TABLES

FIGURES

1   Introduction

1.1 Purpose

The purpose of this document is to provide standards and guidance for the coding and labeling of medical products of human origin: blood, cellular therapy products, tissues, milk, and organs, as well as those plasma derivatives (see Glossary for definition of plasma derivative) for which ABO is relevant.

1.2 Scope

This document is a comprehensive description of the rules surrounding the use of ISBT 128 as well as guidance in the interpretation of these rules. It contains many, but not all, of the reference tables. Locations of reference tables not found in this document may be found on Table 37 [RT036], page 169.

This document is supplemented with other guidance documents that provide greater detail on how ISBT 128 may be implemented.

1.3 Intended Audience

This document is intended for all users of ISBT 128, as well as those interested in implementing the Standard. This includes:

- staff of facilities utilizing, or planning to utilize, the ISBT 128 Standard (management, information technology, validation, quality management, laboratory, etc.)
- software developers
- vendors of labels for medical products of human origin
- vendors of containers for blood and cellular therapy products
- vendors of products that utilize ISBT 128
- regulators and auditors

1.6 Background

The ISBT 128 Standard has been utilized in various countries for many years. It has proven capable of achieving its purpose of conveying information about human transplantation and transfusion products accurately and unambiguously. As communication technology advances, it becomes increasingly important that ISBT 128 is not linked to a particular data transfer technology. This means a variety of delivery mechanisms can be used to transfer information.

From its original role as a labeling standard, ISBT 128 has been re-defined as an international standard for the transfer of information associated with medical products of human origin. It provides for a globally unique donation numbering system, internationally standardized product definitions, and standard data structures for bar coding and electronic data interchange.

The ISBT 128 Standard is a dynamic standard. Changes occur continually as different needs are recognized. Proposals for change follow a managed process, being carefully reviewed by experts in the field in many countries before they are incorporated into the Standard. Proposals are posted on the ICCBBA Website and users from ICCBBA registered facilities can view and comment upon proposals. Every effort is made to ensure that all changes are backward compatible.

1.7 New in This Version

The greatest change for Version 5.0.0 is a restructuring of the Product Description Code Database. Details of this change may be found in *ISBT 128 Standard Product Description Code Database* (ST-010). Software developers and users are urged to read this document as soon as possible to understand the impact of the changes and to begin the process of software upgrades.

The second major change in Version 5.0.0 is the potential of a third character in the data identifier in some new data structures. This change was introduced because there is a finite number of two-character data identifier combinations allotted for ISBT 128 and many of these combinations have been used. The scope of ISBT 128 has been extended to various types of medical products of human origin (MPHO), some of which are in a rapid growth phase such that the full extent of changes needed for ISBT 128 coding is unknown. As new applications for ISBT 128 continue to grow, it can be expected in the not-too-distant future that the number of two-character data identifier combinations will run out. A proactive approach to accommodating the anticipated growth of ISBT 128 data structures has been taken and the Standard has been amended to allow for three-character data identifier combinations. This will give software developers time to accommodate the changes.

The following table indicates the major changes between Version 4.5.0 and Version 5.0.0. **Actual changes or additions to requirements of the ISBT 128 Standard are in bold print**; changes to formatting or organization, or additional guidance, are in regular print.

When changes were a result of a formal proposal, the number of the proposal is listed in the Rationale column.

ISBT 128 Standard Technical Specification Version Control: Version 4.5.0 vs. Version 5.0.0

	Version 4.5.0 Chapter, Section, Table, or Figure	Version 5.0.0 Chapter, Section, Table, or Figure	Change	Rationale
1.	Throughout	Throughout	Changed references to blood, cellular therapy, and tissues to medical products of human origin.	Broader term reflecting fields in which ISBT 128 may be used.

	Version 4.5.0 Chapter, Section, Table, or Figure	Version 5.0.0 Chapter, Section, Table, or Figure	Change	Rationale
2.		1.2	Indicated information about where to find reference tables not in this document can be found in Table 37.	There are now a number a locations such tables may be found and it is no longer practical to list all locations in the Scope.
3.		1.4	Added and updated references.	New documents have been added and some references have been updated.
4.	**2.3, Table 2**	**2.3, Table 2**	**Added Data Structure 035 and 36.**	**New data structure (Proposals 13-004 and 13-005).**
5.	**2.3, Table 2**	**2.3, Table 2**	**Added column to indicate the number of characters in the data identifier.**	**Support having 3 characters in a data identifier (Proposal 13-006).**
6.	**2.3, Table 2**	**2.3, Table 2**	**Added columns for the third character of a data identifier.**	**Provide the third character of the data identifier when applicable (Proposal 13-006).**
7.	2.3, Table 2	2.3, Table 2	Changed the Data Content notation for Data Structures 029 and 030.	Better indicate the repeating segments.
8.	2.4.1	2.4.1	Indicated "yy" represents the year in which the DIN was assigned and deleted information allowing tissue banks to assign the DIN at time of production.	Allows for assigning a DIN to products not already labeled with ISBT 128. Exception for tissue banks is no longer necessary with new definition of "yy".

	Version 4.5.0 Chapter, Section, Table, or Figure	Version 5.0.0 Chapter, Section, Table, or Figure	Change	Rationale
9.		**2.4.3**	**Added W0 codes (W0001 to W0999) to indicate codes for Fecal Microbiota products.**	**To support the coding of Fecal Microbiota.**
10.	2.4.23		Deleted paragraph restricting the use of unstructured messages.	Allow greater flexibility.
11.		**2.4.35**	**Added MPHO Lot Number [Data Structure 035]**	**Support tissue or cell products regulated as medical devices (Proposal 13-004).**
12.		**2.4.36**	**Added MPHO Supplemental Identification Number [Data Structure 036]**	**Support tissue or cell products regulated as medical devices (Proposal 13-005).**
13.	3.1, Table 3	3.1, Table 3	Indicated flag characters with alphanumeric values using numbers in the range 0-9 and alphas in the range A-N, P, R-Y are reserved for future assignment.	Clarification
14.	3.1, Tables 11-13	3.1, Tables 11-13	Indicated that antigen Hr_o in Value 14 is Hr_0 Indicated that antigen Ce in Value 16 is cE Changed font throughout tables supporting Data Structures 012 and 013	Correction of typographical errors. To help distinguish similar characters.

	Version 4.5.0 Chapter, Section, Table, or Figure	Version 5.0.0 Chapter, Section, Table, or Figure	Change	Rationale
15.	**3.1, Table 19**	**3.1, Table 19**	**Changed "na" to "ni" throughout Table 19**	**NI (no information) has a broader meaning. NI can indicate either that results exist but are not encoded, as well as that results are not available or have not been done (Proposal 13-002).**
16.		3.1, Table 21	Added number of rings to express the length of trachea	Needed by tissue banks
17.	**5.1**	**5.1**	**The Product Description Code Database has been restructured. Details of the structure of the database have been moved to a new document:** *ISBT 128 Standard Product Description Code Database* **(ST-010)**	**As the use of ISBT 128 expands to new fields, and as the number of needed classes and attributes increases, it could be foreseen that the old database structure would not accommodate future growth (Proposal 11-004).**
18.	**5.1**	**5.1**	**Added the use of W0 codes.**	**To support assignment of Product Description Codes to Fecal Microbiota.**

	Version 4.5.0 Chapter, Section, Table, or Figure	Version 5.0.0 Chapter, Section, Table, or Figure	Change	Rationale
19.	**5.3**	**5.3**	**Additional fields have been added to the Registered Facilities database.**	**Users requests** • **Information about the type of each facility in the database** • **Inclusion of an alternative name (sometimes called a "Doing Business As" name)** • **ISO country code to support the Single European Coding System for cells and tissues** **(Proposal 12-005)**
20.	6.1.2 and 6.2.2		Removed the reference to ANSI Standard X3.182 1990.	The ISO/IEC 15415 and 15416 standards are appropriate references.
21.		7.3.1	Added a statement that there may be additional requirements for information based on product category or country.	Requirements may vary for specific product categories or in a specific country.
22.	7.4		Removed section on Base Label Bar Code Placement.	This information is specified in separate applicable labeling documents.
23.	7.5		Removed section on Final Label Bar Code Placement.	This information is specified in separate applicable labeling documents.

	Version 4.5.0 Chapter, Section, Table, or Figure	Version 5.0.0 Chapter, Section, Table, or Figure	Change	Rationale
24.	7.6.2.3	7.4.2.3, Table 30	Added lines for MPHO Lot Number and MPHO Supplemental Identification Number.	Provide information on two new data structures.
25.		12, Table 35	Added Object Identifiers	Needed in some HL7 versions.
26.	12, Table 44	12, Table 35	Indicated in IBT1-0011 and IBT1-0012 that division code for Data Structure 003 can also serve as a flag to an alternative division number code.	To support use of the Divisions Data Structure.
27.	12, Table 44	12, Table 35	Removed the explanation in IBT1-0013 that it provided a flag for Data Structure 032.	Error correction
28.		12, Table 35	Added MPHO Lot Number and MPHO Supplemental Identification Code.	New data structures
29.		13.1	Added that ICCBBA is an NGO.	ICCBBA recently became an NGO in official relations with WHO.
30.		Acronyms	Added MPHO and NGO	New acronyms used in this document.

	Version 4.5.0 Chapter, Section, Table, or Figure	Version 5.0.0 Chapter, Section, Table, or Figure	Change	Rationale
31.		Appendix B	Added that the first character of the version for a document is changed when there is a major change to the Standard, as well as to the document.	Clarification.
32.	Appendix D, Table 46	Appendix D, Table 37	Indicated tables RT020-RT024 are found in ISBT 128 Standard Labeling of Blood Components. Indicated RT025 – RT028 are now found in *ISBT 128 Standard Product Description Code Database* (ST-010) Indicated Tables RT047 to RT057 have been added to *ISBT 128 Standard Product Description Code Database* (ST-010)	Tables have been moved and added.

2   Data Structures

Data structures defined in this document are internationally agreed entities for encoding information relevant to medical products of human origin. Data structures define the technical characteristics necessary for the interpretation of the information. They specify the context and structure and provide the links to the appropriate reference tables for conversion of codes to meaningful information.

Data structures need to be clear and unambiguous and must take into account any constraints imposed by the anticipated delivery mechanisms. For example, data structures that will be used in linear bar codes are limited in the number of characters they can contain.

Data structures generally comprise two elements:

- Data identifiers: a two or three-character code that identifies the data structure (described in more detail in 2.1)
- Data content: the data characters that provide the information to be conveyed (e.g., coded information that conveys the unit is A, RhD positive)

Figure 1   Data Structure

Some information may be conveyed at different levels of detail in different data structures. For example, the volume of a blood product may be conveyed in two data structures:

- Product Code [Data Structure 003] as part of the Final Volume attribute group (e.g., equal to or greater than 200 mL to less than 400 mL) or
- Dimensions [Data Structure 029] as a specific value (e.g., 223 mL).

If a facility chooses to use more than one data structure to convey similar information, systems shall be in place to ensure accurate entry of data so the information being conveyed is consistent.

2.1 Data Identifiers

Data identifier characters shall be used in circumstances in which the context of the data structure presentation makes it necessary to also indicate the nature of the information being conveyed. For example, in bar codes the data identifiers are essential to ensure correct interpretation.

However, in applications in which the data structures are being used within an existing framework, such as an electronic data interchange (EDI) message, the data identifiers

may be omitted provided that the message definition unambiguously indicates that the field contains a specific ISBT 128 data structure.

Each ISBT 128 data structure shall have two or three ASCII characters that serve to identify the data structure. The first ASCII character is the first character of the data identifier. It shall always be = (ASCII 61) or & (ASCII 38). These identifiers have been reserved by ANSI (ANSI MH10.8.2-2002) as ISBT 128 data identifiers to distinguish ISBT 128 data structures from all others.

In ICCBBA internationally defined data structures, the second character of the data identifier shall be a non-alphanumeric ASCII character. The exception to this is the Donation Identification Number (DIN) [Data Structure 001]: The DIN shall have a first data identifier character of = and a second data identifier character that can be any of the alphanumeric characters 1–9, A–N, P–Z (but not a–z). Note that for this data structure only, the second data identifier character shall be the first character of the data content.

Data identifiers with the first character "&", and a second character from the range a-z shall be reserved for non-ICCBBA defined data structures (see section 2.5). The data identifier pairs &; and &! shall be hybrid structures which have an ICCBBA defined context but non-ICCBBA defined structure.

Some ICCBBA internationally defined data structures shall have a third data identifier that shall be an alphanumeric character.

The characters used as the second character of the ISBT 128 data identifiers are shown in Table 1, page 21, together with their ASCII values. All ICCBBA documents shall use the US ASCII mapping shown in Table 1 using characters defined in ISO/IEC 646. The character assigned to a particular ASCII value may vary according to the character map being used, but the ASCII value itself provides the definitive description of the data identifier character.

Data identifiers for ISBT 128 data structures are as indicated in Table 2, beginning on page 23.

Table 1   Code 128 Subset B Characters Available for Use as the Second Character of ISBT 128 Data Identifiers [RT001]

ASCII Value	Character	Name
33	!	exclamation mark
34	"	inch, double quotation mark
35	#	number sign
36	$	dollar sign
37	%	per cent sign
38	&	ampersand
39	'	foot, single quotation mark
40	(	left parenthesis
41	)	right parenthesis
42	*	asterisk
43	+	plus sign
44	,	comma
45	-	dash
46	.	period
47	/	forward slash
58	:	colon
59	;	semicolon
60	<	less than
61	=	equal to
62	>	greater than
63	?	question mark
64	@	at sign
91	[	left square bracket
92	\	backward slash
93	]	right square bracket
94	^	circumflex, caret
95	_	underscore
96	`	grave accent
123	{	left brace
124	|	vertical bar
125	}	right brace
126	~	tilde

2.2 The Role of Data Identifiers in ISBT 128 Bar Codes

As indicated in Figure 1, ISBT 128 bar codes comprise two elements: data identifier characters and data content.

In order to accurately interpret information from an ISBT 128 bar code, application software shall carry out the following two steps before interpreting the data values:

1. Analyze the data identifier characters to ensure that the bar code entered is of the correct type;
2. Verify that the length and format of the data characters match that defined for the corresponding data structure.

Failure to carry out these checks could lead to incorrect assignment of critical information.

The following example illustrates this.

An ISBT 128 ABO/RhD Blood Groups [Data Structure 002] bar code for an A, RhD Positive unit will read as:

=%6200

where "=%" are the data identifier characters indicating that this is an ABO/RhD Blood Groups data structure, and "6200" are the data values for A, RhD Positive.

A Special Testing: Red Blood Cell Antigens — General [Data Structure 012] bar code on a Group O, RhD negative unit could have the value:

=\620000000000000000

If the data identifier characters are ignored by the application software, entry of this second bar code in response to a blood groups prompt could cause the system to incorrectly assign the unit as A, RhD Positive.

2.3 Data Structure Index

An index of data structures is provided in Table 2, beginning on page 23, which cross references them to their descriptions in this document.

Table 2   Index of Data Structures [RT003]

Ref	Data Structure Name	Number of Char-acters in Data Identifier	First Character of the Data Identifier		Second Character of the Data Identifier		Third Character of the Data Identifier		Data Content	See Section

2.4 Description of the Data Structures

2.4.1 Donation Identification Number [Data Structure 001]

Note: This is the only data structure in which the second character of the data identifier shall be part of the data content.

Purpose: Data Structure 001 shall specify a Donation Identification Number (DIN) that is a unique identification of a donation event [collection or recovery] or a product pool from anywhere in the world over a one hundred year period.

Structure: =αppppyynnnnnnff

Element	Length	Type
=	1	data identifier, first character
α	1	data identifier, second character alphanumeric {A–N; P–Z; 1–9}
pppp	4	First two characters alphanumeric {A–N, P–Z, 0–9}; second two characters numeric {0–9}. Current usage is numeric for all four characters. Alpha characters may be introduced into positions 1 and 2 in the future (e.g., if α = A and pppp = BC12, the αpppp will be ABC12)
yy	2	numeric {0–9}
nnnnnn	6	numeric {0–9}
ff	2	alphanumeric {0–9}, {A–H, J–N, P, R–Y}

The fifteen (15)-character data content string, **αppppyynnnnnnff**, shall be encoded and interpreted as follows:

αpppp   shall specify the Facility Identification Number (FIN) of the organization that assigned the DIN and shall be encoded and interpreted by reference to the ICCBBA Registered Facilities database published and maintained by ICCBBA in the password-protected area of the ICCBBA Website

yy   shall specify the last two digits of the year in which the DIN was assigned. *Note: In practice, this is the "nominal" year. To cut down on wastage, Donation Identification Number labels may be used for up to one month in the year before, and one month in the year after, the year shown on the label.*

nnnnnn   shall specify a sequence number indicating the particular collection, recovery, or product pool within the given year for the facility identified by the FIN

ff are "flag characters." Use of flag characters "ff" shall conform to national guidelines, if such guidelines exist. As shown in Table 3 on page 83, there are three general types of usage:

- Type 1: Two-character code used for process control and defined by ICCBBA

- Type 2: Two-character code used for process control, but locally defined

- Type 3: A weighted ISO/IEC 7064 modulo 37-2 check character on the entire thirteen character DIN (see Appendix A for method of calculation). Type 3: The check character acts on the Donation Identification Number and acts as a secondary check within the bar code itself.

When not used, the value of the flags shall be 00.

Type 2 flag characters shall only be interpreted by the facility that has defined them or within the group of facilities that have agreed on a common definition.

For a description of one way in which flags can be used see *Technical Bulletin Number 7, Use of Flags in the Donation Identification Number for Process Control of Critical Points during Processing and Distribution* available on the ICCBBA Website.

As shown in Figure 2, the combination, αppppyynnnnnn, forms the Donation Identification Number (DIN). Flag characters, while a part of the Donation Identification Number Data Structure, are not a part of the Donation Identification Number itself. The keyboard entry check character is not a part of the Donation Identification Number but is calculated from the DIN and printed in human readable format. Both the flag characters and the keyboard entry check character are for process control and are not part of the unique identification of the product.

See *Implementation Guide: Use of the Donation Identification Number [Data Structure 001]* for further information.

Figure 2   Donation Numbering
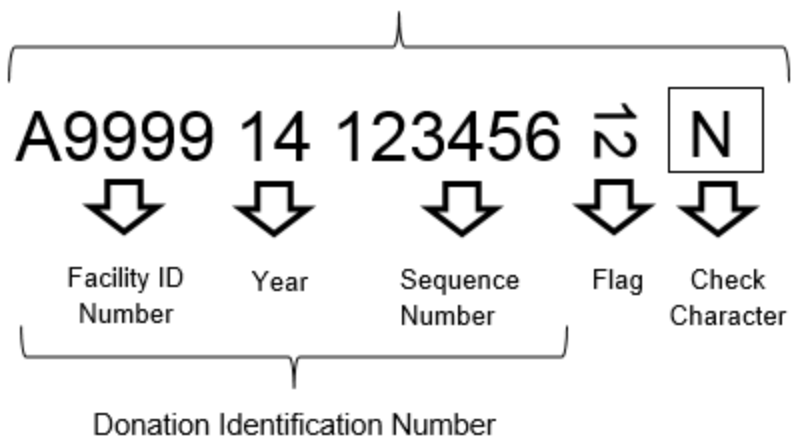

2.4.2 Blood Groups [ABO and RhD] [Data Structure 002]

Purpose: Data Structure 002 EITHER

- Shall indicate the blood groups [ABO and RhD] of a product and
- May convey information regarding C, c, E, e, K, <u>or</u> Miltenberger phenotypes and/or
- May include information defining the type of donation or collection

OR

- Shall convey special messages such as the status of a donation or collection, restrictions on use, or processing instructions.

Structure: =%ggre

Element	Length	Type
=	1	data identifier, first character
%	1	data identifier, second character
gg	2	alphanumeric {A–Z; a–z; 0–9}
r	1	alphanumeric {A–Z; 0–9}
e	1	alphanumeric {A–Z; 0–9}

The four (4)-character data content string, **ggre**, shall be encoded and interpreted as follows:

gg   shall

EITHER

specify ABO and RhD blood groups and type of donation or collection information and shall be encoded and interpreted by reference to Table 4, page 84

OR

specify a range of special messages as shown in Table 5, page 88

r   shall specify RhD and Kell or Miltenberger phenotypes and shall be encoded and interpreted by reference to Table 6, page 89. A value of 0 (zero) shall be used if the data structure does not contain information about these phenotypes

e   shall be reserved for future use. The value of e shall always be set to 0 (zero)

2.4.3   Product Code [Data Structure 003]

Purpose: Data Structure 003 shall:
- identify a product intended for human use
- optionally encode information about the type of donation or collection, and
- encode whether or not the product has been divided

Structure: =<αooootds

Element	Length	Type
=	1	data identifier, first character
<	1	data identifier, second character
α	1	alphabetic {A–Z}
oooo	4	numeric {0–9}
t	1	alphanumeric {A–Z; a–z; 0–9} (depends on value of α, see below)
d	1	alphanumeric {A–Z; 0–9}, (depends on value of α, see below)
s	1	alphanumeric {a–z; 0–9} (depends on value of α, see below)

The eight (8)-character data content string, **αooootds** shall be encoded and interpreted as follows:

αooooo   shall specify the Product Description Code and shall be encoded and interpreted by reference to the Product Description Code database table published and maintained by ICCBBA in the password-protected area of the ICCBBA Website (see 5.1).

α shall specify the following product groups:

- E or F – Blood components
- M – Other therapies (partially assigned):
  - o Human milk – codes beginning with M0 (M0001 to M0999)
  - o Not assigned – codes beginning with M1 through M8 (M1000 to M8999)
  - o Topical products of human origin – codes beginning with M9 (M9000 to M9999)
- N – Partially assigned:
  - o Organs for Transplant – codes beginning with N0 (N0001 to N0999)

- o Not assigned – codes beginning with N1 through N9 (N1000 to N9999)
- R – Partially assigned
  - o Reproductive Tissue – codes beginning with R0 (R0001 to R0999)
  - o Not assigned – codes beginning with R1 through R9 (R1000 to R9999)
- S – Cellular therapy products
- T – Tissues
- V – Ocular tissue
- W – Partially assigned
  - o Fecal Microbiota – codes beginning with W0 (W0001 to W0999)
  - o Not assigned – codes beginning with W1 through W9 (W1000 to W9999)
- X – Derivatives
- A–D – National or local codes (see below).

oooo shall be interpreted through reference to the Product Description Code database

Note: While values of α have previously specified a single type of product (e.g., S was always a cellular therapy product), this is no longer the case. For example, only the first 999 values of M (values beginning with M0) have been reserved for human milk. Codes beginning with M1-M8 may be assigned in the future to other products, and M9 codes (M9000 to M9999) have been assigned to products for topical use (supporting encoding of serum eye drops).

A-D National or Local Codes

The block of Product Description Codes A0000-D9999 shall be reserved for use as nationally or facility defined Product Description Codes. There shall be no international interpretation associated with these values.

These codes should ONLY be used where there is not an appropriate international code and there is good reason why an international code should not be allocated. For example, local codes should be used when a product is only produced in one or a very small number of facilities. If there is any uncertainty whether the code assigned to a product should be international or local/regional/national, the user should contact the ICCBBA office.

National agencies may reserve a range of these values for national assignment. Where this is done it shall be the responsibility of the national agency to ensure that definitions are provided for use within the country and that products bearing such codes are not transferred outside the national boundary.

Individual facilities may also assign codes for their own use provided that these do not conflict with codes assigned at the national level. Where such codes are used, the facility shall ensure that definitions are provided for use within their service region, and that products bearing such codes are not transferred outside their normal distribution network. Care shall be taken in interpreting the product description from a local code as this will be specific to the supplier.

In all cases, the product definition for nationally or facility assigned codes shall be retained permanently for traceability purposes. Once assigned, codes shall not be reassigned.

The encoding and interpretation of **tds** shall depend upon the value of **α**.

If **α** is E or F, then:

t shall specify the type of donation and shall be encoded and interpreted by reference to Table 7, page 90

ds shall specify information as to whether the unit has been divided.

- If the unit has not been divided, **ds** shall be set to the default value of 00 (zero, zero).

- If divisions are encoded in the Product Code,

d shall encode the first level division. First level divisions (up to 26) of the primary collection shall be encoded using capital letters

s shall encode the second level division. Second level subdivisions (up to 26) shall be encoded using lower-case letters

Note: Divisions need not be equal and this nomenclature does not require this. See Use of Product Code Data Structure documents (listed in 1.5) for each product category for examples of use.

See Figure 3. Also see *Use of Product Code [Data Structure 003] – Blood* for examples of use.

If **α** is S, then:

t shall specify the type of donation and shall be encoded and interpreted by reference to Table 7, page 90

ds shall specify information as to whether the unit has been divided.

- If the unit has not been divided, **ds** shall be set to the default value of 00 (zero, zero).

- If the Product Divisions [Data Structure 032] is used, **ds** shall be set to 99. Software shall require that when a 99 appears in positions 7 and 8 of the Product Code [Data Structure 003], the Divisions Data Structure shall be scanned and recorded.

- If divisions are encoded in the Product Code:

   d   may encode the first division. First level divisions (up to 26) of the primary collection shall be encoded using capital letters (See note in text box below)

   s   may encode the second division. Second level subdivisions (up to 26) shall be encoded using lower-case letters (See note in text box below)

   Divisions need not be equal and this nomenclature does not require this.

---

*Note: If **α** is S, until the Product Divisions [Data Structure 032] is implemented, d and s may be used to uniquely identify divisions without regard to hierarchal level. Facilities utilizing this option shall ensure that each product is uniquely identified (i.e., multiple products with the same DIN and Product Description Code shall have a unique division code).*

See Figure 3. Also see *Use of Product Code [Data Structure 003] – Cellular Therapy* for examples of use.

Figure 3   Product Code Structure for Cellular Therapy or Blood
If **α** is M, N, R, T, or V, **tds** shall specify a 3-digit number of divisions (or packs) of the product. If the product has not been divided (or there are not multiple product packs with the same Product Description Code and DIN), **tds** shall be set to 000 (zero, zero, zero).

If **α** is X, tds shall be reserved for future use and the value 000 shall be used.

If **α** is A-D, tds is not defined. If tds is set to something other than 000, it shall be defined in conjunction with the national/local code assignment.

See Figure 4. Also see *Use of Product Code [Data Structure 003] – Tissues* for examples of use.

Figure 4   Product Code Structure for Tissues (including Ocular), Milk, Organs, Reproductive, or Topical Products
2.4.4   Expiration Date [Data Structure 004]

Purpose: Data Structure 004 shall indicate the date at the end of which the item expires. This is intended to be used for medical devices with a human tissue component or for supplies such as filters or solutions. While in the past this data structure has been used for blood, tissue, or cellular therapy products, it is now recommended that Data Structure 005 be used for these products.

Structure: =>cyyjjj

Element	Length	Type
=	1	data identifier, first character
>	1	data identifier, second character
c	1	numeric {0–9}
yy	2	numeric {0–9}
jjj	3	numeric {0–9}

The six (6)-character data content string, **cyyjjj**, is encoded and interpreted as follows:

c   shall specify the century of the year in which the item expires

yy   shall specify the year within the century in which the item expires

jjj   shall specify the ordinal (Julian) date on which the item expires

2.4.5   Expiration Date and Time [Data Structure 005]

Purpose: Data Structure 005 shall indicate the date and time when the product expires.

Structure: &>cyyjjjhhmm

Element	Length	Type
&	1	data identifier, first character
>	1	data identifier, second character
c	1	numeric {0–9}
yy	2	numeric {0–9}
jjj	3	numeric {0–9}
hh	2	numeric {0–9}
mm	2	numeric {0–9}

The ten (10)-character data content string, **cyyjjjhhmm**, shall be encoded and interpreted as follows:

c   shall specify the century of the year in which the product expires

yy   shall specify the year within the century in which the product expires

jjj   shall specify the ordinal (Julian) date on which the product expires

hh   shall specify the hour at which the product expires (00 to 23)

mm   shall specify the minute at which the product expires (00 to 59)

A day shall be defined as beginning at midnight (00:00) and ending at 23:59. When a time is not specified, the default of 2359 shall be encoded in the data structure.

2.4.6   Collection Date [Data Structure 006]

Purpose: Data Structure 006 shall indicate the date on which the product
               was collected or recovered.

Structure: =*cyyjjj

Element	Length	Type
=	1	data identifier, first character
*	1	data identifier, second character
c	1	numeric {0–9}
yy	2	numeric {0–9}
jjj	3	numeric {0–9}

The six (6)-character data content string, **cyyjjj** shall be encoded and interpreted
as follows:

c   shall specify the century of the year in which the product was collected or
           recovered

yy   shall specify the year within the century in which the product was
           collected or recovered

jjj   shall specify the ordinal (Julian) date on which the product was collected
           or recovered

2.4.7   Collection Date and Time [Data Structure 007]

Purpose: Data Structure 007 shall indicate the date and time of collection or recovery of the product.

Structure: &*cyyjjjhhmm

Element	Length	Type
&	1	data identifier, first character
*	1	data identifier, second character
c	1	numeric {0–9}
yy	2	numeric {0–9}
jjj	3	numeric {0–9}
hh	2	numeric {0–9}
mm	2	numeric {0–9}

The ten (10)-character data content string, **cyyjjjhhmm**, shall be encoded and interpreted as follows:

c   shall specify the century of the year in which the product was collected or recovered

yy   shall specify the year within the century in which the product was collected or recovered

jjj   shall specify the ordinal (Julian) date on which the product was collected or recovered

hh   shall specify the hour at which the product was collected or recovered (00 to 23)

mm   shall specify the minute at which the product was collected or recovered (00 to 59)

A day shall be defined as beginning at midnight (00:00) and ending at 23:59. When a time is not specified, the default of 2359 shall be encoded in the data structure.

2.4.8   Production Date [Data Structure 008]

Purpose: Data Structure 008 shall indicate the date on which the product
                was produced. While in the past this has been used for blood,
                tissue, or cellular therapy products, it is now recommended that
                Data Structure 009 be used for these products.

Structure: =}cyyjjj

Element	Length	Type
=	1	data identifier, first character
}	1	data identifier, second character
c	1	numeric {0–9}
yy	2	numeric {0–9}
jjj	3	numeric {0–9}

The six (6)-character data content string, **cyyjjj** shall be encoded and interpreted
as follows:

c   shall specify the century of the year in which the product was produced

yy   shall specify the year within the century in which the product was
           produced

jjj   shall specify the ordinal (Julian) date on which the product was produced

2.4.9   Production Date and Time [Data Structure 009]

Purpose: Data Structure 009 shall indicate the date and time of production of the product.

Structure: &}cyyjjjhhmm

Element	Length	Type
&	1	data identifier, first character
}	1	data identifier, second character
c	1	numeric {0–9}
yy	2	numeric {0–9}
jjj	3	numeric {0–9}
hh	2	numeric {0–9}
mm	2	numeric {0–9}

The ten (10)-character data content string, **cyyjjjhhmm**, shall be encoded and interpreted as follows:

c   shall specify the century of the year in which the product was produced

yy   shall specify the year within the century in which the product was produced

jjj   shall specify the ordinal (Julian) date on which the product was produced

hh   shall specify the hour at which the product was produced (00 to 23)

mm   shall specify the minute at which the product was produced (00 to 59)

A day shall be defined as beginning at midnight (00:00) and ending at 23:59. When a time is not specified, the default of 2359 shall be encoded in the data structure.

2.4.10 Special Testing: General [Data Structure 010]

Purpose: Data Structure 010 shall indicate special characteristics of a product such as whether it has been phenotyped, the presence of antibodies, CMV antibody status, Hemoglobin S status, etc.

Structure: &(zzzzz

Element	Length	Type
&	1	data identifier, first character
(	1	data identifier, second character
zzzzz	5	alphanumeric {A–Z; 0–9}

The five (5)-character data content string, **zzzzz** shall be encoded and interpreted by reference to the Special Testing database table (see 5.2, page 113) published and maintained by ICCBBA in the password-protected area of the ICCBBA Website.

2.4.11 Special Testing: Red Blood Cell Antigens [Data Structure 011]

Data Structure 011 should not be used. It was **RETIRED** in Version 2.1.0 of the *ISBT 128 Standard Technical Specification* (August 2004) and replaced by Data Structures 012 and 013.

Purpose: Data Structure 011 is maintained for backwards compatibility. It provided information regarding red blood cell phenotypes and CMV antibody status of the product.

Structure: ={aaaaaaaaaaaaaaaaii

Element	Length	Type
=	1	data identifier, first character
{	1	data identifier, second character
aaaaaaaaaaaaaaaa	16	numeric {0–9}
ii	2	numeric {0–9}

The eighteen (18)-character data content string, **aaaaaaaaaaaaaaaaii**, shall be encoded and interpreted using Table 8, starting on page 91 and Table 11, page 97.

2.4.12 Special Testing: Red Blood Cell Antigens – General [Data Structure 012]

Purpose: Data Structure 012 shall provide information regarding red blood cell phenotypes (see glossary), CMV antibody, IgA, Parvovirus B19, and Hemoglobin S status of the product.

Structure: =\aaaaaaaaaaaaaaaaii

Element	Length	Type
=	1	data identifier, first character
\	1	data identifier, second character
aaaaaaaaaaaaaaaa	16	numeric {0–9}
ii	2	numeric {0–9}

The eighteen (18)-character data content string, **aaaaaaaaaaaaaaaaii**, shall be encoded and interpreted using Table 9, starting on page 93 and Table 12, Page 98.

Common Rh antigens may be encoded together as a phenotype (Rh column 1 on Table 9, page 93) or as individual Rh antigens (C,c,E,e, columns 14-16). If Rh antigens are encoded individually using positions 14, 15, and/or 16, then the value of column 1 shall be set to 9 (no information). Conversely, if the phenotype is present in column 1, then the values of the C,c,E,e antigens shall all be set to 9, ni (no information).

See Examples of Use in 9.1, page 129.

If there are Red Blood Cell Antigens that have been tested for, but that are not encoded using Table 9 and Table 12, positions 17 and 18 may be set to 00 (see Table 12) and information concerning the status of those antigens may be indicated on the label text. Alternatively, red cell antigens not found on these tables may be encoded using the Red Cell Antigens with Test History (Data Structure 030). For information on this data structure, see 2.4.30 on page 69.

2.4.13   Special Testing: Red Blood Cell Antigens — Finnish [Data Structure 013]

Purpose: Data Structure 013 shall provide information regarding red blood cell phenotypes (see glossary), CMV antibody, and IgA status of the product. The Finnish table reflects different antigen distributions in the Finnish population.

Structure: &\aaaaaaaaaaaaaaaaii

Element	Length	Type
&	1	data identifier, first character
\	1	data identifier, second character
aaaaaaaaaaaaaaaa	16	numeric {0–9}
ii	2	numeric {0–9}

The eighteen (18)-character data content string, **aaaaaaaaaaaaaaaaii**, shall be encoded and interpreted using Table 10, starting on page 95 and Table 13, page 99.

If there are Red Blood Cell Antigens that have been tested for, but that are not encoded using Table 10 and Table 13, positions 17 and 18 may be set to 00 (see Table 13) and information concerning the status of those antigens may be indicated on the label text. Alternatively, red cell antigens not found on these tables may be encoded using the Red Cell Antigens with Test History (Data Structure 030). For information on this data structure, see 2.4.30 on page 69.

2.4.14 Special Testing: Platelet HLA and Platelet Specific Antigens [Data Structure 014]

Purpose: Data Structure 014 shall provide information regarding HLA and HPA phenotypes, CMV antibody, IgA status, and anti-A and -B for platelet products. If genomic typing is used, only the first two digits of the type shall be encoded.

Structure: &{AAAABBBBCCCCCCCCDE

Element	Length	Type
&	1	data identifier, first character
{	1	data identifier, second character
AAAA	4	numeric {0–9}
BBBB	4	numeric {0–9}
CCCCCCCC	8	numeric {0–9}
D	1	numeric {0–9}
E	1	numeric {0–9}

The eighteen (18)-character data content string, AAAABBBBCCCCCCCCDE, shall be encoded and interpreted as follows:

AAAA shall specify HLA-A antigens and shall be encoded and interpreted according to Table 14, beginning on page 100.

BBBB shall specify HLA-B antigens and shall be encoded and interpreted according to Table 14, beginning on page 100.

Two **AA** values shall be encoded, followed by two **BB** values. To conform to practice the lower value shall always be listed first. See Examples of Use in 9.2, page 130.

CCCCCCCC shall specify platelet-specific antigens, IgA antigen and CMV antibody status and shall be encoded and interpreted according to Table 15, page 102.

D shall be reserved for future use. A default value of 0 (zero) shall be used at this time

E shall specify information about high titered antibodies to A and B antigens and shall be encoded and interpreted according to Table 16, page 103.

2.4.15 Special Testing: HLA-A and -B Alleles [Data Structure 015]

Data Structure 015 has been **RETIRED** as of this version of the *ISBT 128 Standard Technical Specification* (December 2011).

Purpose: Data Structure 015 is retained for backward compatibility. It provided information regarding HLA-A and - B alleles for Cellular Therapy and Tissue products. This is the first of a pair of data structures (see 2.4.16).

Structure: =[EEEEFFFFGGGGHHHHLM

Element	Length	Type
=	1	data identifier, first character
[	1	data identifier, second character
EEEE	4	numeric {0–9}
FFFF	4	numeric {0–9}
GGGG	4	numeric {0–9}
HHHH	4	numeric {0–9}
L	1	numeric {0–9}
M	1	numeric {0–9}

EEEE   shall specify the first four digits of the first of the pair of HLA-A (usually) genomically-determined alleles

FFFF   shall specify the first four digits of the second of the pair of HLA-A (usually) genomically-determined alleles

GGGG   shall specify the first four digits of the first of the pair of HLA-B (usually) genomically-determined alleles

HHHH   shall specify the first four digits of the second of the pair of HLA-B (usually) genomically-determined alleles

The 16-character data content string, **EEEEFFFFGGGGHHHH**, shall be encoded and interpreted using the table described in 4.1, page 109.

To conform to practice the lower value of each pair shall always be listed first.

Only the first four digits of the HLA-A and -B alleles are significant for transfusion and transplantation, because the fifth and any subsequent characters describe synonymous mutations.

00 shall be used after the first two characters to signify that typing of the respective HLA-locus has been performed using a method that does not allow allele discrimination at higher resolution than two (2) digits.

The value in the data structure for a null allele shall be 0000.

L shall specify the CMV antibody status (see Table 17, page 104)

M shall be reserved for future use; a default of 9 shall be used at this time.

2.4.16   Special Testing: HLA-DRB1 Alleles Data Structure 016

Data Structure 016 has been **RETIRED** as of this version of the *ISBT 128 Standard Technical Specification* (December 2011).

Purpose: Data Structure 016 is retained for backward compatibility. It provided information regarding HLA-DRB1 alleles for Cellular Therapy and Tissue products. This is the second of a pair of data structures (see 2.4.15).

Structure: ="IIIIJJJJMMMMMMMMMM

Element	Length	Type
=	1	data identifier, first character
"	1	data identifier, second character
IIII	4	numeric {0–9}
JJJJ	4	numeric {0–9}
MMMMMMMMMM	10	numeric {0–9}

IIII   shall specify the first four digits of the first of the pair of HLA-DRB1 (usually) genomically-determined alleles

JJJJ   shall specify the first four digits of the second of the pair of HLA-DRB1 (usually) genomically-determined alleles

The 8-character data content string, **IIIIJJJJ**, shall be encoded and interpreted using the table described in 4.1, page 109.

To conform to practice the lower value of each pair shall always be listed first. Only the first four digits of the HLA-DRB1 alleles are significant for transfusion and transplantation, because the fifth and any subsequent characters describe synonymous mutations.

00 shall be used after the first two characters to signify that typing of the respective HLA-locus has been performed using a method that does not allow allele discrimination at higher resolution than two (2) digits.

The value in the data structure for a null allele shall be 0000.

MMMMMMMMMM shall be reserved for future use. A default value of 9999999999 shall be used at this time.

2.4.17 Container Manufacturer and Catalog Number [Data Structure 017]

Purpose: Data Structure 017 shall specify the manufacturer and catalog number of the container set and the identifying character(s) of the individual container(s) in the set.

Structure: =)bqqwwwwwww

Element	Length	Type
=	1	data identifier, first character
)	1	data identifier, second character
b	1	alphanumeric {A–Z; 0–9}
qq	2	alphanumeric {A–Z; 0–9}
wwwwwww	7	alphanumeric {A–Z; a–z; 0–9}

The ten (10)-character data content string, **bqqwwwwwww** shall be encoded and interpreted as follows:

b   shall specify the container identification character in a container or transfer set. The value of b is set as follows:
- For whole blood and other non-apheresis collection sets, 1-9 shall be used. 1 shall be reserved for the primary collection container
- for apheresis collection sets A-Z shall be used
- For transfer container/sets, 0 (zero) is used. If more than one type of container is present in the transfer set, numeric characters 2-9 may also be used. (The number 1 shall be reserved for the primary bag of a whole blood collection set.)

qq   shall specify the identity of the container set manufacturer and is encoded and interpreted from Table W1, Manufacturer Identifier Codes (described in Section 4.2, page 109)

wwwwwww   shall specify the manufacturer's catalog number. This shall be interpreted from information provided by the manufacturer. If the catalog number is less than seven (7) characters, it shall be padded with zeroes at the beginning of the string (i.e., the catalog number 27QzE would be transmitted as 0027QzE)

Used in conjunction with the Manufacturer's Data file (see Chapter 11, page 136 and *Implementation Guide, Use of the Manufacturers Data File*), this data structure can be a powerful tool for process control. With use of appropriate software and downloading of the data file, much information about the container

set can be determined automatically. This information includes the number of bags in the set, the anticoagulant/preservative, the intended nominal collection volume, etc.

Figure 5   Container Manufacturer and Catalog Number
2.4.18   Container Lot Number [Data Structure 018]

Purpose: Data Structure 018 shall specify the manufacturer's lot number for the container set.

Structure: &)xxxxxxxxxx

Element	Length	Type
&	1	data identifier, first character
)	1	data identifier, second character
xxxxxxxxxx	10	alphanumeric {A–Z; a–z; 0–9}

The ten (10)-character data content string, **xxxxxxxxxx**, shall encode the manufacturer's lot number. If the lot number is less than ten (10) characters, it shall be padded with zeroes at the beginning of the string (i.e., the lot number 1234rZ would be transmitted as 00001234rZ).

Because lot numbers can be padded with zeroes, ideally they should not begin with a 0 (zero). If the lot number begins with 0 (zero), the manufacturer shall have a mechanism to ensure correct identification of the lot number when a problem is reported and the lot number is indicated without the leading 0 (zero).

This data structure shall be used in conjunction with Data Structure 017.

2.4.19 Donor Identification Number [Data Structure 019]

Purpose: Data Structure 019 shall specify a donor identification number that is unique anywhere in the world.

Structure: =;αppppvvvvvvvvvvvvvvvv

Element	Length	Type
=	1	data identifier, first character
;	1	data identifier, second character
α	1	alphanumeric {A–N; P–Z; 1–9}
pppp	4	First two characters alphanumeric {A–N, P–Z, 0–9}, second two characters numeric {0–9}. Current usage is numeric for all four characters. Alpha characters may be introduced into positions 1 and 2 in the future.
vvvvvvvvvvvvvvvv	16	numeric {0–9}

The twenty-one (21)-character data content string, **αppppvvvvvvvvvvvvvvvv**, shall be encoded and interpreted as follows:

αpppp   shall specify the Facility Identification Number (FIN) and is encoded and interpreted by reference to the ICCBBA Registered Facility table (see 5.3, page 114) published and maintained by ICCBBA in the password-protected area of the ICCBBA Website

vvvvvvvvvvvvvvvv   shall specify either a nationally- or facility- assigned donor identification number. The interpretation of the assigned number requires knowledge of how such numbers are assigned in the country specified by the FIN. If the number assigned is not sixteen (16) characters, it shall be padded with zeroes at the beginning of the string (i.e., the donor identification number 395421746 would be transmitted as 0000000395421746). However, in some countries, the assigned number can begin with zero; therefore the specific length of the assigned number must be known in order to correctly interpret this data structure

2.4.19.1 Use of a National Donor Identification Number

If the Donor Identification Number is nationally-assigned using this data structure, a dedicated FIN can be assigned by ICCBBA to distinguish nationally- from facility-assigned numbers. To exercise this option, a national authority should contact the ICCBBA office (tech.director@iccbba.org).

Note: There is an alternative nationally-defined data structure that may be used for a donor identification number (see 2.5.2, page 82).

2.4.20 Staff Member Identification Number [Data Structure 020]

Purpose: Data Structure 020 shall specify a staff identification number.

Structure: ='αppppuuuuuu

Element	Length	Type
=	1	data identifier, first character
'	1	data identifier, second character
α	1	alphanumeric {A–N; P–Z; 1–9}
pppp	4	First two characters alphanumeric {A–N, P–Z, 0–9}, second two characters numeric {0–9}. Current usage is numeric for all four characters. Alpha characters may be introduced into positions 1 and 2 in the future.
uuuuuu	6	alphanumeric {A–Z, 0–9}

The eleven (11)-character data content string, **αppppuuuuuu**, shall be encoded and interpreted as follows:

αpppp shall specify the Facility Identification Number (FIN) and shall be encoded and interpreted by reference to the ICCBBA Registered Facility table (see 5.3, page 114) published and maintained by ICCBBA in the password-protected area of the ICCBBA Website

uuuuuu shall specify a facility-assigned staff member identification number. As noted above, the number may contain alphabetic characters if desired. If the string assigned is not six (6) characters, it shall be padded with zeroes at the beginning of the string (i.e., the staff member identification 395A would be transmitted as 00395A)

2.4.21 Manufacturer and Catalog Number: Items Other Than Containers [Data Structure 021]

Purpose: Data Structure 021 shall specify the manufacturer and the catalog number of an item used in collection or processing other than the container (set).

Structure: =-NNOOOOOOOO

Element	Length	Type
=	1	data identifier, first character
-	1	data identifier, second character
NN	2	alphanumeric {A–Z; 0–9}
OOOOOOOO	8	alphanumeric {A–Z; a–z; 0–9}

The ten (10)-character data content string, **NNOOOOOOOO** shall be encoded and interpreted as follows:

NN   shall specify the identity of the item manufacturer and is encoded and interpreted from Table W1, Manufacturer Identifier Codes (described in Section 4.2, page 109)

OOOOOOOO shall specify the manufacturer's catalog number. This shall be interpreted from information provided by the manufacturer. If the catalog number is less than eight (8) characters, it shall be padded with zeroes at the beginning of the string (i.e., the catalog number 27QzE would be transmitted as 00027QzE)

2.4.22 Lot Number: Items Other Than Containers [Data Structure 022]

Purpose: Data Structure 022 shall specify the manufacturer's lot number for an item used in collection or processing other than a container (set).

Structure: &-PPPPPPPPPP

Element	Length	Type
&	1	data identifier, first character
-	1	data identifier, second character
PPPPPPPPPP	10	alphanumeric {A–Z; a–z; 0–9}

The ten (10)-character data content string, **PPPPPPPPPP**, shall encode the manufacturer's lot number. If the lot number is less than ten (10) characters, it shall be padded with zeroes at the beginning of the string (i.e., the lot number 1234rZ would be transmitted as 00001234rZ).

Because lot numbers can be padded with zeroes, ideally they should not begin with a 0 (zero). If the lot number begins with 0 (zero), the manufacturer shall have a mechanism to ensure correct identification of the lot number when a problem is reported and the lot number is indicated without the leading 0 (zero).

This data structure shall be used in conjunction with Data Structure 021.

2.4.23 Compound Message [Data Structure 023]

Purpose: Data Structure 023 shall allow multiple data structures to be combined into a single data string to facilitate use of newer technology delivery systems.

Structure: =+aabbb

Element	Length	Type
=	1	data identifier, first character
+	1	data identifier, second character
aa	2	numeric {0–9}
bbb	3	numeric {0–9}

The five-character data content string **aabbb** shall be encoded and interpreted as follows:

aa shall specify the number of ISBT 128 data structures that follow;

bbb shall be either:

- all zeros – indicating this is an undefined message, i.e. only the number of data structures is identified, but not what each one is

- a three-digit number referencing an entry in an ICCBBA maintained table that defines the content of this structured compound message (see Table W2, [RT017] Structured Compound Messages described in Section 4.3, page 109)

Rules for constructing compound messages:

1. A compound message shall comprise a string of ISBT 128 data structures (excluding nationally defined structures), beginning with the Compound Message [Data Structure 023]

2. Data structures shall be combined with no intervening characters in the order shown on Table RT017 for the structured message selected, and each data structure shall begin with its data identifier characters

3. The string shall only contain ISBT 128 data structures

4. The number of data structures following the Compound Message Data Structure shall be indicated in element aa of the Compound Message Data Structure

5. If an ICCBBA structured compound message format is used, the reference number of the structure shall be included in element bbb of the Compound Message Data Structure

6. If the message is not defined, the Compound Message Data Structure shall have element bbb set to zeros, and element aa shall be set as specified in rule 4

ICCBBA structured compound messages are defined in Table W2, Structured Compound Messages (described in Section 4.3, page 109). Requests for additional entries should be submitted to the ICCBBA office (tech.director@iccbba.org).

Reading software should always verify the integrity of the data string, including checking that the correct number of data structures appears. Data should only be interpreted if the integrity of the entire data string has been confirmed.

See 9.3, page 131, for an example of use.

2.4.24 Patient Date of Birth [Data Structure 024]

Purpose: Data Structure 024 shall indicate the date of birth of the patient and the location of this occurrence of the information.

Structure: =#aayyyymmdd

Element	Length	Type
=	1	data identifier, first character
#	1	data identifier, second character
aa	2	numeric {0–9}
yyyy	4	numeric {0–9}
mm	2	numeric {0–9}
dd	2	numeric {0–9}

The 10 character data content string, **aayyyymmdd**, shall be encoded and interpreted as follows:

aa shall specify a location code identifying where this occurrence of the information is held. For acceptable values see Table 18, page 104

yyyy shall specify the year of birth

mm shall specify the month of birth

dd shall specify the day of birth

See *Technical Bulletin 8: Specification for ISBT 128 Data Structures to Support the Secure Bedside Matching of Patient and Transfusion/Transplant Product Identification* for examples of use.

2.4.25 Patient Identification Number [Data Structure 025]

Purpose: Data Structure 025 shall indicate the patient identification number and the location of this occurrence of the information.

Structure: &#aallxx…xx

Note: This is a variable length structure – see text below.

Element	Length	Type
&	1	data identifier, first character
#	1	data identifier, second character
aa	2	numeric {0–9}
ll	2	numeric {0–9}
xx…xx	var	alpha/numeric {A-Z, a–z, 0–9}

The variable length data content string, **aallxx…xx**, shall be encoded and interpreted as follows:

aa   shall specify a location code identifying where this occurrence of the information is held. For acceptable values see Table 18, page 104

ll   shall specify the length of the following patient number field

xx…xx   shall specify the patient identification number, alpha numeric only, punctuation characters and spaces are not permitted

Note: The patient identification number may only be unique within the facility in which it was assigned. There may be duplicate numbers if a patient moves from one facility to another.

Reading software should always verify the integrity of the data string, including checking that the correct number (as defined by ll) of characters appears in the patient identification number.

See *Technical Bulletin 8: Specification for ISBT 128 Data Structures to Support the Secure Bedside Matching of Patient and Transfusion/Transplant Product Identification* for examples of use.

2.4.26 Expiration Month and Year [Data Structure 026]

Purpose: Data Structure 026 shall indicate a month and year of expiration for supplies. This data structure should not be used for blood, tissue, or cellular therapy products.

Structure: =]yyyymm

Element	Length	Type
=	1	data identifier, first character
]	1	data identifier, second character
yyyy	4	numeric {0–9}
mm	2	numeric {0–9}

The six character data string **yyyymm** is encoded and interpreted as follows:

yyyy   shall specify the year of expiration

mm   shall specify the month of expiration

2.4.27 Infectious Markers [Data Structure 027]

Purpose: Data Structure 027 shall provide information on the infectious disease screening status of a product.

Structure: &"nnnnnnnnnnnnnnnnnn

Element	Length	Type
&	1	data identifier, first character
"	1	data identifier, second character
nnnnnnnnnnnnnnnnnn	18	numeric {0–9}

The 18 character data content string, **nnnnnnnnnnnnnnnnnn**, shall be encoded and interpreted as follows:

nnnnnnnnnnnnnnnnnn   shall specify a string of digits, each of which shall identify the result status of a pair of markers as indicated in Table 19, page 105. Currently only values in the first nine positions have been defined; therefore positions 10-18 shall be set to a value of 0. For each marker there shall be three possible outcomes:

pos   Reactive for specified marker in screening process

neg   Specific marker not detected in screening process

ni   No information encoded. Additional information may be present in accompanying documentation.

The information shall be specific to a particular donation and thus shall be provided in a manner that can be securely linked to the Donation Identification Number. This may be achieved by the use of a Compound Message structure containing both the Donation Identification Number and Infectious Marker screening, concatenated bar code reading, or by other mechanisms that secure association of the information.

The results provided in the data string shall be the final outcome of the approved screening process of the testing facility.

Generally, it is expected that this information will appear in electronic communications or accompanying documentation rather than on the affixed label of a product.

For an example of use for this data structure, see 9.4, page 132.

2.4.28 Product Consignment [Data Structure 028]

Purpose: Data Structure 028 shall transfer information about product
              shipments.

Structure: =$αppppyynnnnnccdd

Element	Length	Type
=	1	data identifier, first character
$	1	data identifier, second character
α	1	alphanumeric {A–N; P–Z; 1–9}
pppp	4	First two characters alphanumeric {A–N, P–Z, 0–9}, second two characters numeric {0–9}. Current usage is numeric for all four characters. Alpha characters may be introduced into positions 1 and 2 in the future.
yy	2	numeric {0–9}
nnnnn	5	numeric {0–9}
cc	2	numeric {0–9}
dd	2	numeric {0–9}

The sixteen character data string **αppppyynnnnnccdd** shall be encoded and
interpreted as follows:

αpppp   shall specify the Facility Identification Number (FIN) and is
                encoded and interpreted by reference to the ICCBBA
                Registered Facility table (see 5.3, page 114) published and
                maintained by ICCBBA in the password-protected area of the
                ICCBBA Website

yy   shall specify the year

nnnnn   shall specify a serial number

cc   shall specify the number of the container within consignment.
                For dispatch documentation (paper or electronic), this field shall
                be set to 00

dd   shall specify the total number of containers in consignment

2.4.29   Dimensions [Data Structure 029]

Purpose: Data Structure 029 shall carry information about the dimensions (length, area, volume, etc.) of a product.

Structure: &$nnaabbbbcccccdee…aabbbbcccccdee

Element	Length	Type
&	1	data identifier, first character
$	1	data identifier, second character
nn	2	numeric value {00–99}
		Repeating segments (repeats nn times):
aa	2	numeric value {0–9}
bbbb	4	numeric value {0–9}
ccccc	5	numeric value {0–9}
d	1	numeric value {0–9}
ee	2	numeric value {0–9}

The data content string, **nnaabbbbcccccdee**, shall be encoded and interpreted as follows:

nn   Number of repeating segments

             Repeating segment (repeats nn times):

aa   Refers to a symbol as defined by Table 20, page 107

bbbb   Refers to a dimension as defined by the Table 21, page 107

ccccc   Value of the dimension specified in the associated Product Description Code. Dimension values are in accordance with the limits of accuracy specified in the supplier's product catalog or product insert. Should the measured value be less than 5 characters, leading zeroes shall be used

d   Number of decimal places as defined in Table 22, Page 107

ee   Reserved for future use, set to 00 default

There is no requirement for the order in which dimensions may appear in the data string. Software shall be written to place a value in the appropriate field based on the value of aa and bbbb of the Dimensions Data Structure.

If the Dimensions Data Structure does not appear on an affixed label, it should be linked to the Donation Identification Number to which it corresponds. It is strongly recommended that a Compound Message [Data Structure 023] that incorporates both the DIN and Dimensions Data Structures be used (see 2.4.23).

If more than one dimension is conveyed and a linear bar code is used, the symbol may be too large to fit on the affixed label. In this situation, it is anticipated that this data structure will be used in electronic communication or on documents accompanying the product rather than on the container label.

Reading software should always verify the integrity of the data string, including checking that the correct number of repeating segments occurs. Data should only be interpreted if the integrity of the entire data string has been confirmed.

For examples of use and implementation guidance, see *Implementation Guideline, Dimensions [Data Structure 029],* on the ICCBBA Website.

2.4.30 Red Cell Antigens with Test History [Data Structure 030]

Purpose: Data Structure 030 shall transfer information about red cell antigen phenotypes (see glossary), including whether the test has been performed more than once and if the results represent current or historical data. It is anticipated that this data structure will be used in electronic communication or on documents accompanying the product rather than on the affixed label.

Structure: &%nnnpppppprrss…pppppprrss

Element	Length	Type
&	1	data identifier, first character
%	1	data identifier, second character
nnn	3	numeric {0–9}
		Repeating segment (repeats nnn times):
pppppp	6	numeric {0–9}
rr	2	numeric {0–9}
ss	2	numeric {0–9}

The character data string **nnnpppppprrss** shall be encoded and interpreted as follows:

nnn   Shall indicate the number of occurrences of the repeating segment in the data structure

     Repeating segment (repeats nnn times):

pppppp   ISBT-defined antigen as defined by the table described in 4.4, page 110. The blood group system number should be listed first, followed by the antigen number.

rr   Result interpretation as defined by Table 23, page 108

ss   Number of tests as defined by Table 24, page 108

There is no requirement for the order in which antigens may appear in the data string. Software shall be written to place an antigen in the appropriate field based on the value of pppppp.

When utilizing this data structure to express more than one test result, the results shall be concordant.

Information in the Red Cell Antigen with Test History Data Structure shall be firmly linked to the Donation Identification Number to which it corresponds. It is strongly recommended that a Compound Message [Data Structure 023] that incorporates both the DIN and the Red Cell Antigen with Test History Data Structures be used (see 2.4.23).

Reading software should always verify the integrity of the data string, including checking that the correct number of repeating segments occurs. Data should only be interpreted if the integrity of the entire data string has been confirmed.

For examples of use and implementation guidance, see *Implementation Guideline, Red Cell Antigen [Data Structure 030]*, on the ICCBBA Website.

2.4.31 Flexible Date and Time [Data Structure 031]

Purpose: Data Structure 031 shall convey information about date and time, including the type of time (collection, recovery, production, cross clamp, etc.) and the time zone (local or UTC).

Date of Implementation: For cellular therapy, ocular tissue, and organs this structure is available for use immediately. For other categories of product, this data structure is not an option immediately to allow software developers to create, and users to validate, software capable of reading the data structure.

Structure: =(ZUTTYYYYMMDDhhmm

Element	Length	Type
=	1	data identifier, first character
(	1	data identifier, second character
Z	1	numeric {0–9}
U	1	numeric {0–9}
TT	2	numeric {0–9}
YYYY	4	numeric {0–9}
MM	2	numeric {0–9}
DD	2	numeric {0–9}
hh	2	numeric {0–9}
mm	2	numeric {0–9}

The 16-character data string **ZUTTYYYYMMDDhhmm** shall be encoded and interpreted as follows:

Z   Shall specify local or UTC time interpreted from Table 25, page 108

U   Shall be reserved for future use. The value shall be set to 0.

TT   Shall specify the type of time interpreted from Table 26, page 108

YYYY   Shall specify the year

MM   Shall specify the month (01-12)

DD   Shall specify the day (01-31)

hh   Shall specify the hour (00-23)

mm   Shall specify the minute (00-59)

2.4.32 Product Divisions [Data Structure 032]

Purpose: Data Structure 032 shall convey information about divisions, or if used in conjunction with a medical device that does not contain HCT/P, a serial number.

Date of implementation:

When used in conjunction with Data Structure 003: Because this data structure becomes part of the unique identification of a product, implementation of the data structure must be coordinated so that computer systems of facilities receiving the product are able to scan and interpret the codes. Therefore, **this data structure shall not be used for cellular therapy product in general distribution at this time**. Technical Advisory Groups will determine when it is acceptable to use it for labeling products and the rules for its use (e.g., 2-D bar code). This document will be updated when the decision has been made. At this time, it is presented for the benefit of software developers to update software to support its use.

The data structure may be used sooner for cellular therapy products if:
* A product will remain in a facility
* There is an agreement between supplier and receiver of a product to utilize this data structure sooner

When used in conjunction with Data Structure 034: This data structure may be used at any time.

Note: At the present time, use of the Divisions Data Structure with Data Structure 003 is restricted to Cellular Therapy product codes (where α is S) and for products identified using Data Structure 034. However, in the future the use of the Divisions Data Structure may be extended to blood products (where α is E or F).

Structure: =,dddddd

Element	Length	Type
=	1	data identifier, first character
,	1	data identifier, second character
dddddd	6	alphanumeric {A–Z, 0–9}

The 6-character data string dddddd shall be encoded and interpreted as follows:

dddddd   shall specify the division code

The division code allows for a high level of flexibility.

- Digits shall be used where a single level of divisions is required (allowing up to 999,999 divisions).
- If it is desirable to show levels of divisions (to allow for divisions of divisions), alpha characters shall be used. In this situation, the six character field may be split into three pairs, each allowing AA through to ZZ. This provides up to three levels of division.
- For a serial number for products without a human donor component, either numbers or alphas, or a combination, can be used.

When the Product Divisions Data Structure is used in conjunction with the Product Code (Data Structure 003), "99" shall appear in the 7th and 8th positions of the Product Code. See Section 2.4.3. The Divisions Data Structure, when used, is essential for traceability. Software shall require that when a 99 appears in positions 7 and 8 of the Product Code [Data Structure 003], the Divisions Data Structure shall be scanned and recorded. If manual records are maintained, the Divisions Code shall be recorded along with the Donation Identification Number and the Product Code for all records needed for traceability.

Each Product Divisions code shall be unique for a given Product Code [Data Structure 003] and DIN.

For use of this data structure in conjunction with the Product Code [Data Structure 003] see *Implementation Guide, Use of Product Divisions [Data Structure 032]*.

For use of this data structure in conjunction with the Processor Product Identification Code [Data Structure 034], see *Coding and Labeling of Medical Devices using ISBT 128*.

2.4.33 Processing Facility Information Code [Data Structure 033]

Purpose: Data Structure 033 shall convey information about the facility that assigned the product code and may include a facility product code assigned by the processing or labeling facility.

Structure: &+nnnnnpppppp

Element	Length	Type
&	1	data identifier, first character
+	1	data identifier, second character
nnnnn	5	alphanumeric {A–N, P–Z, 0–9}
pppppp	6	alphanumeric {A–Z, 0–9}

The 11-character data string nnnnnpppppp shall be encoded and interpreted as follows:

nnnnn   shall specify the Facility Identification Number, or the FIN (P), of the facility that assigned the Product Code and is encoded and interpreted by reference to the ICCBBA Registered Facility table published and maintained by ICCBBA in the password-protected area of the ICCBBA Website. The facility that assigned the Product Code may, or may not, be the same facility that assigned the Donation Identification Number (DIN).

This code, in conjunction with the DIN (Data Structure 001) and Product Code (Data Structure 003), may be required for unique identification of the product. If the FIN within Data Structure 033 is required to ensure unique identification of the product, it shall be presented in a 2D barcode to ensure it is read.

pppppp   shall specify a Facility Product Code (FPC) assigned by the processing or labeling facility indicating a catalog or other number that identifies the product within its system. The FPC shall not be used to create uniqueness for the product. The processing or labeling facility may choose to publish reference tables for use by the organizations receiving the product. If a value is not required, the default value 000000 (zeroes) shall be used.

2.4.34   Processor Product Identification Code [Data Structure 034]

Purpose: Data Structure 034, the Processor Product Identification Code (PPIC), shall identify the processing or labeling facility, a facility-assigned facility product code, and a standardized product description code. This data structure may be used for medical device identification.

Structure: =/nnnnnppppppqqqqq

| Element	Length	Type
=	1	data identifier, first character
/	1	data identifier, second character
nnnnn	5	alphanumeric {A–N, P–Z, 0–9}
pppppp	6	alphanumeric {A–Z, 0–9}
qqqqq	5	alphanumeric {A–Z, 0–9}

The 16-character data string nnnnnppppppqqqqq shall be encoded and interpreted as follows:

nnnnn   shall specify the Facility Identification Number, or the FIN(P), of the facility that assigned the Product Code and shall be encoded and interpreted by reference to the ICCBBA Registered Facility table published and maintained by ICCBBA in the password-protected area of the ICCBBA Website. The facility that assigned the Product Code may, or may not, be the same facility that assigned the Donation Identification Number (DIN).

pppppp   shall specify a Facility Product Code (FPC) assigned by the processing or labeling facility indicating a catalog or other number that identifies the product within its system. This code shall not be used to create uniqueness for the product. If a value is not required, the default value 000000 (zeroes) shall be used. This facility may choose to publish reference tables for use by the organizations receiving the product.

qqqqq   shall be encoded and interpreted by reference to the Product Description Code database table published and maintained by ICCBBA in the password-protected area of the ICCBBA Website.

Medical devices with a human donor component shall be uniquely identified using Data Structure 034, the Donation Identification Number [Data Structure 001], and Product Divisions [Data Structure 032].

See *Implementation Guide, Coding and Labeling of Medical Devices Using ISBT I28* for more information.

Standardized
Product
Description
Code
2.4.35   MPHO Lot Number [Data Structure 035]

Purpose: Data Structure 035 shall be used for the lot number of Medical Products of Human Origin

Structure: &,1xxxxxxxxxxxxxxxxxx

Element	Length	Type
&	1	data identifier, first character
,	1	data identifier, second character
1	1	data identifier, third character
xxxxxxxxxxxxxxxxxx	18	alphanumeric {A–Z; a–z; 0–9}

The data content string shall be up to 18 characters and shall be encoded and interpreted as follows:

xxxxxxxxxxxxxxxxxx   Facility defined lot number

This data structure shall not be used to uniquely identify a product.

2.4.36   MPHO Supplemental Identification Number [Data Structure 036]

Purpose: Data Structure 036 shall be used for a supplemental identification number for MPHO

Structure: &,2xxxxxxxxxxxxxxxxxx

Element	Length	Type
&	1	data identifier, first character
,	1	data identifier, second character
2	1	data identifier, third character
xxxxxxxxxxxxxxxxxx	18	alphanumeric {A–Z; a–z; 0–9}

The data content string shall be up to 18 characters and shall be encoded and interpreted as follows:

xxxxxxxxxxxxxxxxxx   Facility defined identification number

This data structure shall not be used to uniquely identify a product.

2.5 Non-ICCBBA Defined Data Structures

2.5.1   Data Structures Not Defined by ICCBBA

Data structures that fit in the ISBT 128 model but are not internationally defined by ICCBBA may be desirable for use by individual facilities or by regional, national, or supranational authorities. The data identifiers &a through &z shall be reserved to support such data structures.

There should be a national consensus regarding which data identifiers should be reserved for national use and which, if any, should be allowed for regional or supranational use.

The Facility Identification Numbers (FINs) to which the definition of these data structure applies shall be documented and software shall only interpret these data structures within the context of those FIN(s).

Non-ICCBBA defined data structures shall not be used in Compound Messages.

Element	Length	Type
&	1	data identifier, first character
a–z	1	data identifier, second character
Further elements will be nationally (or regionally) defined.		

Note: Care should be taken not to confuse these non-ICCBBA defined data structures with locally- or nationally-assigned Product Description Codes (see Section 2.4.3, page 33).

Note: There are internationally defined data structures for nationally-defined Donor Identification Number [Data Structure 019] and Patient identification Number [Data Structure 025].

2.5.2 Reserved Data Identifiers for a Nationally-Specified Donor Identification Number

A nationally-specified data structure may be defined to contain a unique donor (not donation) identification number. The data identifier shall be "&;".

Element	Length	Type
&	1	data identifier, first character
;	1	data identifier, second character
Further elements will be nationally defined.		

Note: There is an alternative internationally-defined data structure that may be used for a donor identification number (see 2.4.19, page 55).

2.5.3 Confidential Unit Exclusion Status Data Structure

If desired, a nationally-specified structured bar code may be defined to contain the results of a confidential donor decision to request that a donated unit be either accepted for testing and processing or discarded. The data identifier shall be "&!".

Element	Length	Type
&	1	data identifier, first character
!	1	data identifier, second character
Further elements will be nationally defined.		

3 Reference Tables

3.1 Reference Tables Maintained in This Document

Table 3   Data Structure 001: Donation Identification Number Flag Digits, ff [RT004]

Value of ff	Meaning When Used in the Donation Identification Number
00	Flag not used; null value
01	Container 1 of a set
02	Container 2 of a set
03	Container 3 of a set
04	Container 4 of a set
05	Second (or repeated) "demand-printed" label
06	Pilot tube label
07	Test tube label
08	Donor record label
09	Sample tube for NAT testing
10	Samples for bacterial testing
11	Match with Unit label
12	Affixed partial label
13	Attached label (intended to be used with affixed partial label)
14	Reserved for future assignment
15	Container 5 of a set
16	Container 6 of a set
17	Container 7 of a set
18	Container 8 of a set
19	Container 9 of a set
20-59	Reserved for assignment and use by each local facility. Therefore the meaning and interpretation of flag values 20–59 may differ with each FIN and should not be interpreted at any other site
60–96	ISO/IEC 7064 modulo 37-2 check character on the preceding thirteen (13) data characters, **αppppyynnnnnn** including the FIN, year and the unit sequence number — value is assigned as 60 plus the modulo 37-2 checksum
97–99	Reserved for future assignment
Alphanumeric using numbers in the range 0-9 and alphas in the range A-N, P, R-Y	Reserved for future assignment

Table 4   Data Structure 002: Blood Groups [ABO and RhD], Including Optional Type of Donation or Collection Information [RT005]

ABO and RhD Blood Groups	Default: Intended Use Not Specified	Directed (Dedicated/ Designated) Collection Use Only	For Emergency Use Only	Directed (Dedicated/ Designated) Collection/ Biohazardous	Directed (Dedicated/ Designated) Collection/ Eligible for Crossover	Autologous Collection/ Eligible for Crossover	For Autologous Use Only	For Autologous Use Only/ Biohazardous

Table 5   Data Structure 002: Special Messages [RT006]

gg	Interpretation
Ma	Autologous collection
Mb	Biohazardous
Md	Discard (to be destroyed)
Mf	For fractionation use only
Mq	Quarantine/hold for further testing or processing
Mr	For research use only
Mx	Not for transfusion based on test results
T1	RhD positive*
T2	RhD negative*
T3	RhD not specified*
T4	Autologous collection/in quarantine*
T5	See outer packaging for product status*
T6	Must be sterilized before release*

*Values in Table 5 that begin with the letter T (T1-T6) shall be used only with tissue products.

Table 6   Data Structure 002: Rh, Kell, and Mia/Mur Phenotypes [RT007]

Results with Anti-Kell:			Phenotype:			
Not tested	**Negative**	**Positive**	**C**	**c**	**E**	**e**
0	S	T	not tested	not tested	not tested	not tested
1	A	J	negative	positive	negative	positive
2	B	K	positive	positive	negative	positive
3	C	L	positive	positive	positive	positive
4	D	M	positive	positive	positive	negative
5	E	N	negative	positive	positive	positive
6	F	O	negative	positive	positive	negative
7	G	P	positive	negative	negative	positive
8	H	Q	positive	negative	positive	positive
9	I	R	positive	negative	positive	negative
X	Y	Z	negative	not tested	negative	not tested
U			Miª/Mur negative			
V			Miª/Mur positive			
W			Special Testing bar code present and must be scanned and interpreted			

Values of **r** {0–9, A–T, X–Z} are used to encode the results of testing for K, C, c, E, and e as shown in this table. (For example, if the value of **r** is **E**, then the red blood cells are K-negative, C-negative, c-positive, E-positive and e-positive). Values U and V encode Miª/Mur antigen test results.

Table 7   Data Structure 003: Type of Donation or Collection in 6th Position of Product Code [RT008]

Character	Type of Donation
0 (zero)	Not specified (null value)
V	Volunteer homologous (allogeneic) donor (default)
R	Volunteer research donor
S	Volunteer source donor
T	Volunteer therapeutic collection
P	Paid homologous (allogeneic) collection
r	Paid research collection
s	Paid source collection
A	Autologous collection, eligible for crossover
1 (one)	For autologous use only
X	For autologous use only, biohazard
D	Volunteer directed collection, eligible for crossover
d	Paid directed collection, eligible for crossover
2	For directed recipient use only
L	For directed recipient use only, limited exposure
E	Medical exception, for specified recipient only (allogeneic)
Q	See (*i.e.*, read [scan]) Special Testing bar code
3	For directed recipient use only, biohazard
4	Designated collection
5	Dedicated collection
6	Designated collection, biohazard

Table 20 Data Structure 029: Symbols [RT037]

Value	Description
01	Dimension is equal to the expressed value within a tolerance defined by the facility
02	Dimension is greater than the expressed value
03	Dimension is greater than or equal to the expressed value
04	Dimension is less than the expressed value
05	Dimension is less than or equal to the expressed value
06	Dimension is the nominal value as defined within a circular of information/package insert for the product

Table 21 Data Structure 029: Dimensions [RT038]

Value	Units	Description
0001	mL	Volume of the associated product including the anticoagulant/additive
0002	mm	Length of the associated product
0003	mm	Width of the associated product
0004	mm	Height of the associated product
0005	mm	Particle size of the associated product
0006	cm^2	Area of the associated product
0007	10E9	Total number of platelets in the container of the associated product
0008	g	Weight of associated product excluding the container but including the anticoagulant/additive
0009	g	Tare weight of container
0010	g	Tare weight of container and attached tubing
0011	rings	Length of trachea expressed in number of rings

Table 22 Data Structure 029: Decimal Point [RT039]

Value	Meaning	Example
0	Integer value	12345
1	Decimal point between fourth and fifth numbers	1234.5
2	Decimal point between third and fourth numbers	123.45
3	Decimal point between second and third numbers	12.345
4	Decimal point between first and second numbers	1.2345
5	Decimal point is in the first position	.12345

Table 23   Data Structure 030: RBC Serological Results [RT040]

Value	Meaning
01	Negative – Test methodology not specified
02	Positive – Test methodology not specified
03	Negative – Serological testing
04	Positive – Serological testing
05	Negative – Predicted phenotype based on genotyping
06	Positive – Predicted phenotype based on genotyping

Table 24   Data Structure 030: Number of Tests [RT041]

Value	Meaning
01	Tested once on this donation
02	Tested once on prior donation
03	Tested ≥ twice on different donations (current and historic) with concordant results
04	Tested ≥ twice on different donations (historic only) with concordant results
05	Tested ≥ twice on this donation only, different samples, with concordant results

Table 25   Data Structure 031: Time Zone [RT045]

Value	Meaning
1	Local time zone of facility assigning the date
2	Coordinated Universal Time (abbreviated UTC)

Table 26   Data Structure 031: Type of Time [RT046]

Value	Meaning
01	Expiration date and time
02	Collection date and time
03	Production date and time
04	Cross Clamp date and time

4 Reference Tables Maintained on Websites

4.1 Data Structures 015 and 016: HLA Genomic Typing

To encode for HLA-A, -B, and –DRB1 alleles, ISBT 128 utilized a database maintained by the European Bioinformatics Institute (EBI), which is part of the European Molecular Biology Laboratory (EMBL). This database provided for sequences of the human major histocompatibility complex (HLA) and included the official sequences for the WHO Nomenclature Committee for factors of the HLA System. The IMGT/HLA Database is part of the international ImMunoGeneTics project (IMGT).

Data Structures 015 and 016 have been retired as of Version 4.1.0 of the *ISBT 128 Standard Technical Specification* (December 2011). The data structures were retired because they could not accommodate the increased number of characters required to encode HLA alleles that occurred in April 2010.

Continued use of Data Structures 015 and 016 should reflect terminology used prior to April 2010. The data structures cannot support newer antigens which require more than 4 characters. A crosswalk of allele names from their current name to the name prior to April 2010 may be found at:

ftp://ftp.ebi.ac.uk/pub/databases/imgt/mhc/hla/Nomenclature_2009.txt

4.2 Table W1 Data Structures 017 and 021: Manufacturer Identifier Codes [RT016]

This table is maintained on the ICCBBA Website at:

http://www.iccbba.org/tech-library/iccbba-documents/databases-and-reference-tables/reference-tables

4.3 Table W2 Data Structure 023: Structured Compound Messages [RT017]

This table is maintained on the ICCBBA Website at:

http://www.iccbba.org/tech-library/iccbba-documents/databases-and-reference-tables/reference-tables

4.4 Data Structure 030: Red Cell Antigens with Test History

This table is maintained by the Working Party on Red Cell Immunogenetics and Blood Group Terminology of the International Society of Blood Transfusion and posted at:

http://www.isbtweb.org/fileadmin/user_upload/WP_on_Red_Cell_Immunogenetics_and/Table_of_blood_group_antigens_within_systems_v3.0_121028.pdf

5   Database Tables

In addition to the Reference Tables in Chapter 3, ICCBBA maintains ISBT 128 database tables using Microsoft Access® or Microsoft Excel®. These tables are too large and/or complex to be maintained as simple tables in this document.

A second format, as separate comma- or tab- delimited files, is provided for those who wish to use a different database program or who wish to download the databases into their own systems. These database tables are kept in the password-protected area of the ICCBBA Website and are only available to registered users who are current with their annual license fee.

5.1 Product Description Codes

There shall be a single ISBT 128 Product Description Code database for all categories of products (blood components, human milk, topical products of human origin, organs for transplant, reproductive tissue, cellular therapy products, tissues, ocular tissue, fecal microbiota, and derivatives). Each category shall be distinguished by its group prefix character(s): E or F, M0, M9, N0, R0, S, T, V, W0, and X, respectively, permitting individual tables to be extracted.

The Product Description Code forms the first five characters of the eight-character Product Code Data Structure. A product in the ISBT 128 database shall be defined by a unique combination of the characteristics. Each such combination shall be given a five character Product Description Code, the first character(s) of which shall identify the product category (E, F, M0, M9, N0, R0, S, T, V, W0, or X, as noted above), and the remaining characters shall provide a unique sequence number. These codes shall be maintained in a table in the database named Product Description. The Product Description Code shall identify a product by mapping, via the Product Description table, to the unique combination of Class, Modifier, and Attribute(s) characteristics, which are referenced in the associated database tables.

Version numbers for the database table shall be derived as described in Appendix B. The version of a database is maintained in a table named Version.

The ISBT 128 Product Description Code database has been restructured to accommodate future growth. As the use of ISBT 128 continues to grow (more than 10,000 product description codes in eight categories of products now exist), it is foreseen that the original database design will not continue to be adequate. While the limitations of the database have not been reached, it is better to be proactive and redesign the database in a way that will support anticipated growth in advance. Therefore, a new database design was created to replace the original database. By making the restructured database available now, it gives software developers time to adapt their software before the old database design is unable to handle the number and variety of products using ISBT 128. While it cannot be foreseen just how long the old database design will continue to meet the needs, ICCBBA strongly recommends that software that utilizes more than just the product description codes (e.g., uses product

formulas) be updated as soon as possible. ICCBBA will continue producing the current tables until the end of 2016, unless the original table structures can no longer support new products. **Details of the new database structure may be found in *ISBT 128 Standard Product Description Code Database* (ST-010).**

The structure of the new database may not affect all existing ISBT 128 software. Existing software that only utilizes the ISBT 128 product description code should not be affected. The Product Description Codes themselves have not been redefined or restructured.

All ISBT 128 database tables shall be published in the password-protected area of the ICCBBA Website. This file is a Microsoft Access® file and is named:

Product Description Codes Database – Access 2000

The structure of the database is described in *ISBT 128 Product Description Code Database* (ST-010).

More information about use of the Product Description Code database for different product categories may be found in the following documents:

Use of Product Code [Data Structure 003], Blood (IG-021)
Use of Product Code [Data Structure 003], Cellular Therapy (IG-022)
Use of Product Code [Data Structure 003], Tissues (IG-020)
Use of the Product Code [Data Structure 003], Ocular Tissue (IG-032)
Coding and Labeling of Medical Devices Using ISBT I28 (ST-011)

5.2 Special Testing: General [Data Structure 010]

This database shall contain the test names and codes for data conveyed in Data Structure 10. It shall be published in the password-protected area of the ICCBBA Website. This file shall be a Microsoft Access® file and shall be named:

Special Testing General – Access 2000

A comma-delimited text file of the table in the Special Testing: General database (Special Testing General Text) shall also be provided to permit end-users to incorporate this table into any preferred database application.

Version numbers for the database table shall be derived as described in Appendix B.

Table 27   Special Testing: General [RT029]

Field Name	Field Size	Constraints	Field Description
NCODE	5	Primary key Required, no duplicates	UNIQUE ISBT 128 Special Testing Code
INTERPRETATION	200	Required, no duplicates	Information conveyed by the Special Testing Code
RETIREDATE	11		Date on which it was recommended that code no longer be used for new products. Code is maintained in the database for backward compatibility. Format is DD MMM YYYY. The field is blank for current codes.

Table 28   VERSION Table (Special Testing) [RT043]

Field	Field Type	Field Size	Description
Version Number	Text	50	The version number of the special testing database
Date	Text	11	The date issued. The format is DD MMM YYYY

5.3 Facility Identification Number Identification Code

This database shall contain the names and locations of all ICCBBA registered facilities. It is published in the password-protected area of the ICCBBA Website. This file shall be a Microsoft Excel® file and be named:

Registered Facilities – xls

It shall also be available on the Website as a tab delimited text file (Registered Facilities – Text).

Table 29   Registered Facilities [RT030]

Field Name	Field Size	Field Description
FIN	5	Facility Identification Number*
Firm Name	100	Legal name of facility
City	60	Mailing address details of facility
State/Province	20	Mailing address details of facility
Country	20	Mailing address details of facility
Postal Code	10	Mailing address details of facility
Website	100	Website of the facility
Alternative Name	100	A second name associated with the facility
Country ISO	2	Code for country as assigned in ISO 3166-1*
Facility Type	80	Indicates category or categories of products the facility manages

*10 FINs have been set aside for validation purposes. These are A9990-A9999.
ICCBBA has used the user-defined country code of XA (as allowed by ISO 3166-1) for these FINs.

6   Delivery Mechanisms for ISBT 128 Data Structures

ISBT 128 data structures can be delivered using a number of different technologies including linear bar codes, two-dimensional (2-D) bar codes, wireless radio frequency identification transponders (RFID tags), and EDI messages. Rules for such uses of ISBT 128 data structures will depend on the delivery mechanism.

6.1 Linear Symbols

6.1.1   General Requirements

ISBT 128 data structures represented as linear bar codes shall use Code 128 symbology and be compliant with ISO/IEC 15417. Implementers shall ensure that a switch can be made to subset C of the Code 128 symbology where appropriate in order to reduce bar code length.

6.1.2   Symbol Print Quality

As described in ISO/IEC 15416, print quality of a Code 128 symbol shall be 1.5/6/670 where 1.5 is the overall quality, 6 is the measuring aperture reference number (corresponding to a 0.15 mm diameter aperture) and 670 is the peak response wave length in nanometers.

6.1.3   Symbol Dimensions

Nominal module width (X): The X dimension shall be constant throughout a given symbol. The X dimension is the width of the narrowest bar within the bar code symbol.

Whenever possible, ISBT 128 bar codes used on a container label should be printed using a nominal X dimension of 0.25 mm, and in no case shall they be printed at a nominal X dimension smaller than 0.17 mm.

Any use of an ISBT 128 data structure as a linear printed bar code (i.e., not only on container labels, but on test tubes, etc.) should use an X dimension that meets these criteria.

Non-ICCBBA defined bar codes (such as national use bar codes) used on blood labels should meet the criteria listed above.

Note: Printers and scanners need to be compatible with the X dimension selected.

Bar Code Quiet Zones: The minimum width of a quiet zone shall be 10X.

A "quiet zone" is the clear space preceding the start character of the bar code and that following the stop character. This quiet zone is essential for the reading of the symbol.

There shall be no printing in direct contact with the top and bottom of the bar code.

Bar Code Height: In accordance with the recommendation in Annex G of ISO/IEC 15417, the bar code height shall be at least 5 mm or 15% of the symbol length, whichever is greater, on product labels that will leave the facility in which the products were labeled. For bar codes on labels or documents that will not leave the facility in which they were created, users should validate the minimum height of a label that can be read with their scanning equipment and ensure labels meet this internal requirement.

Concatenated Bar Codes: For linear bar codes that may be concatenated, the distance between the two bar codes shall fall within the specified range (see Chapter 10).

6.2 2-D Symbols

6.2.1   General Requirements

Data Matrix (ECC 200) shall be used as the 2-D symbology for ISBT 128 container labels. The ISO/IEC 16022 Information technology—International symbology specification—Data Matrix shall be followed.

For applications of ISBT 128 other than container labels, Data Matrix is recommended.

6.2.2   Symbol Print Quality

As described in ISO/IEC 15415, print quality shall be 1.5/6/670 where 1.5 is the overall quality, 6 is the measuring aperture reference number (corresponding to a 0.15 mm diameter aperture) and 670 is the peak response wave length in nanometers.

6.2.3   Symbol Dimensions

X dimension: The nominal X dimension shall be a minimum of 0.25 mm and a maximum of 1 mm. Within these criteria, as large an X dimension as practical should be used.

Finder pattern: The width of the finder pattern shall equal X.

Alignment pattern: The width of the alignment pattern shall equal 2X.

Quiet zone: The minimum quiet zone shall be equal to X on all four sides. For applications with moderate to excessive reflected noise in close proximity to the symbol, a quiet zone of 2X to 4X is recommended.

6.2.4   Reading and Interpreting Information

Software should be written to ensure that the full data string matches the information provided in the Compound Message data structure and Table W2, Structured Compound Messages described in Section 4.3, page 109.

Once verification is complete, the data string can be parsed into its individual data structure elements and handled in the same way as the corresponding linear code entry. In this way software can operate independently of the input format and products labeled with linear and 2-D codes can be handled simultaneously.

Each data structure in the string should be verified individually in the same way that their linear counterparts are verified.

For further information on implementation of 2-D symbols, see Implementation Guide: *Use of Data Matrix symbols with ISBT 128*.

6.3 RFID Tags

Use of RFID technology for blood components should comply with the guidelines published in Vox Sanguinis [Knels R, Davis R, Ashford P, et al: Guidelines for the use of RFID technology in transfusion medicine. Vox Sang 2010; 98(S2):1-24]. These guidelines recommend:

- The use of passive HF (13.56 MHz)
- That the user follow ISO 18000-3, tag standard and the ISO 15961 and ISO 15962 data encoding rules.
- That ISBT 128 data structures be used within the message.

Additional guidance will be provided as this technology develops.

6.4 EDI Messages

Rules for incorporating ISBT 128 data structures into EDI messages will normally be specified by the body responsible for the message standard. The only restriction placed by ICCBBA is that data identifier characters are a required part of the data field unless the message standard provides an alternative means of unambiguously identifying a data field as containing a specific ISBT 128 data structure, in which case they may be omitted.

For messages following the HL7 Standard, see Chapter 12.

7   Product Labeling

7.1 Specific Product Labeling

For information on labeling of specific products, see
- *ISBT 128 Standard Labeling of Blood Components*
- *ISBT 128 Standard Labeling of Cellular Therapy Products*
- *ISBT 128 Standard Labeling of Human Tissues*
- *ISBT 128 Standard Labeling of Ocular Tissue*

7.2 National Labeling Guidelines

National bodies may publish guidelines for labeling which adhere to the ISBT 128 Standard. ICCBBA maintains on its Websites examples of such national documents. For assistance in creating such national guidelines, or to share a national guideline on the ICCBBA Website, contact the ICCBBA office (tech.director@iccbba.org).

7.3 General Principles

Two label general types are specified in ISBT 128: The label applied by the manufacturer of the container referred to as the base label and the label placed on a product container by the processing facility referred to as the final label.

The following general principles apply to label design:

Primary considerations in label design shall include improving the safety of the product and the efficiency of processing/administering. If these two considerations conflict, safety shall take precedence over efficiency.

Critical information on the container shall dominate the label via position and prominence and shall take precedence over information that is of little importance to the end-user (clinician, nurse, laboratory staff, and other hospital personnel).

To assist in label design, if more than one linear bar code is to be placed in a quadrant, e.g., Expiration Date and Special Testing, some adjustment of the absolute position of bar codes other than those for Data Structures 001, 002, 003 and 005 is permissible. Additionally, depending on the amount of text that is required, it may be necessary to reduce bar code height in accordance with bar code height requirements described 6.1.3, beginning on page 115.

A library of example labels from different countries is posted on the ICCBBA Website.

7.3.1   Minimum Information

Traceability of medical products of human origin labeled with ISBT 128 requires, at a minimum,
1) Every ISBT 128-labeled product shall carry an electronically readable Donation Identification Number and Product Code.
2) Every ISBT 128-labeled product shall carry data content text for Donation Identification Number and Product Code.
3) These (1 and 2 above) should appear on the affixed label whenever possible.
4) If linear bar codes are used and the affixed label is too small to carry both bar codes, then the DIN bar code shall appear on the affixed label, along with data content text for DIN and Product Code. The DIN and Product Code bar codes shall also be carried together on an attached label or on accompanying documentation. (Note: For traceability, both the ISBT 128 DIN and Product Code, which includes both the Product Description Code and the division/pack code, are required.)
5) Additional information may be required based on product category and/or country. See specific labeling documents for additional information.

7.4 Printing Label Text

When printing identification numbers such as the DIN, the font selected must allow differentiation between similar characters (e.g., 0/O and 1/I).

7.4.1   Data Content Text for Linear Bar Codes

The data content text is the representation of the data characters in a bar code that is printed left justified immediately below a linear bar code, unless otherwise specified (see Figure 10, page 157).

Every Code 128 bar code on a container label shall be accompanied by data content text. Bar code data identifiers are non-data characters and therefore shall appear only in the bar codes, not in the data content text.

7.4.1.1 Donation Identification Number [001]

The data content text for a Donation Identification Number is unique in that it is the sole means of presenting the data content of the bar code, i.e., it serves the dual role of data content text and bar code text. As bar code text it shall be printed using a sans serif typeface. A national authority should determine how it should be displayed, for example:

V0043 14 499999

A123 4140 12346

7004 203 123 456

All data characters shall be printed (in this instance only, the second data identifier character is also a data character).

The flag characters "ff" may be used to convey specific information other than the unique identification of the product and shall be distinguished from the Donation Identification Number (see 2.4.1).

When Type 1 or Type 2 flag characters are used (see page 29) they shall be printed as either:

- Numeric Presentation: The two-digit values of flags "ff" shall be printed rotated 90° clockwise to make them visually different from the Donation Identification Number.

W0000 09 123456 ⧖ [G]
Flag Characters

- Non-numeric Presentation: A graphical icon or other representation of the value of "ff", e.g., for flag "07" printing an icon showing a small test tube.

Type 3 flag characters (see page 29) shall not be printed.

7.4.1.2 Container Manufacturer and Catalog Number [017] and Container Lot Number [018]

Information on printing text for these data structures is found in *ISBT 128 Standard Labeling of Blood Components.*

7.4.1.3 All Other Bar Codes

Data content text shall appear immediately below, but not touching, the bar code; commence in line with the leftmost bar of the bar code and be represented in sans serif type with a maximum height of 2 mm (see Figure 10, page 157).

7.4.2 Keyboard Entry Check Character K

A keyboard entry check character **K** shall be used when data content text appears in conjunction with the following data structures in order to verify correct manual entry of the data content:

- Donation Identification Number [001]
- Special Testing: Red Blood Cell Antigens [011]
- Special Testing: Red Blood Cell Antigens — General [012]
- Special Testing: Red Blood Cell Antigens — Finnish [013]
- Special Testing: Platelet HLA and Platelet-Specific Antigens [014]
- Special Testing: HLA-A and –B Alleles [015]
- Special Testing: HLA-DRB1 Alleles [016]
- Donor Identification Number [019]
- Infectious Marker [027]

K is not part of the data content string but is calculated from it using the ISO/IEC 7064 modulo 37-2 checksum method. **K** is a character in the range {A-Z, 0-9, *} determined from the modulo 37 remainder of the weighted sum of the data content string as shown in Table 36 in Appendix A. For an example of the calculation for the 13-character string α**ppppyynnnnnn** of the Donation Identification Number see Appendix A.

7.4.2.1 Donation Identification Number

In the case of Data Structure 001 (Donation Identification Number), the calculation shall be based on the Donation Identification Number only, i.e., excluding the flag characters.

7.4.2.2 Other Data Structures

For other bar codes, the keyboard entry character may be used (see Table 30, page 123). Because the ISO/IEC 7064 modulo 37-2 checksum method does not allow for lower case alpha characters, it shall not be used in data structures that have lower case alpha characters.

7.4.2.3 Printing the Check Character

Wherever the keyboard check character is printed, it shall be clearly distinguished from data content. When printed in association with the data content text of a code, a box shall be drawn around the keyboard entry check character.

For example, a Red Cell phenotype would be printed:

95978999759924799 D

Because of the significance of this particular character, it shall be printed in a typeface that clearly distinguishes alphabetic and numeric characters; e.g., there shall be no confusion between 1 (one) and I (capital letter I), or between 0 (zero) and O (capital letter O).

Table 30 Keyboard Entry Check Character Requirements for ISBT 128 Data Structures Utilizing Code 128 [RT002]

Ref	Data Structure Name	Modulo 37-2 Keyboard Entry Check Character [K]
001	Donation Identification Number	Required
002	Blood Groups [ABO and RhD]	Not applicable
003	Product Code	Not applicable
004	Expiration Date	Optional
005	Expiration Date and Time	Optional
006	Collection Date	Optional
007	Collection Date and Time	Optional
008	Production Date	Optional
009	Production Date and Time	Optional
010	Special Testing: General	Optional
011	Special Testing: Red Blood Cell Antigens (retired)	Required
012	Special Testing: Red Blood Cell Antigens — General	Required
013	Special Testing: Red Blood Cell Antigens — Finnish	Required
014	Special Testing: Platelet HLA and Platelet-Specific Antigens	Required
015	Special Testing: HLA-A and –B Alleles (RETIRED)	Required
016	Special Testing: HLA-DRB1 Alleles (RETIRED)	Required
017	Container Manufacturer and Catalog Number	Not applicable
018	Container Lot Number	Not applicable
019	Donor Identification Number	Required
020	Staff Member Identification Number	Optional
021	Manufacturer and Catalog Number: Items Other Than Containers	Not applicable
022	Lot Number: Items Other Than Containers	Not applicable
023	Compound Message	Not applicable
024	Patient Date of Birth	Optional
025	Patient Hospital Identification Number	Not applicable
026	Expiration Month and Year	Optional

Ref	Data Structure Name	Modulo 37-2 Keyboard Entry Check Character [K]
027	Infectious Markers	Required
028	Product Consignment	Optional
029	Dimensions	Optional
030	Red Cell Antigens with Test History	Not applicable
031	Flexible Date and Time	Optional
032	Product Divisions	Optional
033	Processing Facility Information Code	Optional
034	Processor Product Identification Code	Optional
035	MPHO Lot Number	Not applicable
036	MPHO Supplemental Identification Number	Not applicable

7.4.3   Bar Code Text

Bar code text is the interpretation of the data content text (the data content of the bar code) in terminology meaningful to the user (see Figure 10, page 157). Bar code text is nationally defined to allow for differences in language, regulatory requirements, and preferences.

Particular font sizes and types are not specified for bar code and additional text but designers shall ensure clarity of all text and use larger fonts to emphasize critical information. The font chosen should clearly differentiate between similar characters (e.g., O and 0; I and 1). Sans serif fonts shall be used for Latin alphabets. The use of color (for example, for ABO) is neither prohibited nor encouraged.

Bar code text corresponding to information content of electronically readable information shall appear on the label. If the size of the label does not support the information content required by this standard, appropriate regulations and requirements of standard setting organizations should be consulted. Some required information may need to appear on secondary packaging if permitted by regulations and pertinent standards.

7.4.3.1 Product Descriptions [Data Structure 003]

Where space permits, the Class, Modifier (if present), and Attributes (except default Attributes) text shall be printed on the label.

Product description bar code text should be printed with the Modifier proportionally smaller than the Class proper name and Attribute(s) text should be proportionately smaller than Modifier text.

Figure 8   Relative Text Size of Class, Modifier, and Attributes

WASHED
RED BLOOD CELLS
IRRADIATED
7.4.3.2 Dates [Data Structures 004, 005, 006, 007, 008, 009, 024]

Dates shall be printed in compliance with ISO 8601-2004 extended format or in the format day — month — year. In the latter case, the day shall be numerical, the month alphabetical, using a three-letter abbreviation. The year shall be a four-digit numerical representation.

Expiration Date:

2011-03-17

OR

17 MAR 2011

Note: Abbreviations for month shall comply with relevant national standards where applicable.

Times shall be printed based on a twenty-four hour clock with a colon placed between the hours and minutes.

For Cellular Therapy products with text expiration times, time zones shall be taken into consideration. If the product is to be shipped across time zones, FACT and JACIE Standards require that the text expiration date and time include the local time zone abbreviation. In addition, the ISBT 128 Standard requires that the label include the Universal Coordinated Time (UTC) when the product is to be shipped across an international time zone.

The UTC shall be printed beneath the local time in parenthesis with the designation "UTC". Italics may also be used to clearly differentiate UTC from local time. For example:

Expiration Date/Time:

15 JAN 2011 15:15 EST
(15 JAN 2011 20:15 UTC)

OR

2011-01-15 15:15 EST
(2011-01-15 15:15 UTC)

Note: It is recognized that local time zone designations may have little meaning internationally since two time zones may have the same abbreviation (e.g., EST can mean Eastern Standard Time in Australia, which is UTC+10 hours or Eastern Standard Time in North America, which is UTC -5 hours). However, the Cellular Therapy Coding and Advisory Group (CTCLAG) believe that local time zones are more readily interpreted within a continent. For products shipped to different continents, UTC should be used to interpret time.

7.4.3.3 Month-Year [Data Structure 026]

The date shall be printed in compliance with ISO 8601-2004 extended format or in the format month — year. In the latter case, the month alphabetical expression shall use a three-letter abbreviation. The year shall be a four-digit numerical representation.

2011-03

OR

MAR 2011

Note: Abbreviations for month shall comply with relevant national standards where applicable.

7.4.3.4 Donor Identification Number [Data Structure 019]

When the Donor Identification Number is less than 16 digits, it shall be padded with zeros at the beginning of the actual number. If desired, software developers can routinely strip off padding and present the actual number when printing the number or displaying the number on a screen.

For example:

In Denmark, a possible data content string would be:

000000 080656 1665

a ten (10)-digit number with six (6) leading zeroes as padding. This number might display on a screen as **080656 1665.**
In France, it might be:

0 1 56 05 18 033 087 78

a fifteen (15)-digit number with a single (1) leading zero as padding. This number might display on the screen as **1 56 05 18 033 087 78.**

7.4.4   Additional Text

Additional text is defined as text not associated with a bar code. Additional text includes warnings (e.g., "This product may transmit infectious agents") and information such as Volunteer Donor or a platelet yield on a platelet apheresis product.

The placement of this information is not standardized internationally, but may be standardized nationally. Users should review national documents for additional information.

If not nationally defined, facilities may add additional text to the label where space permits and there is need.

Particular font sizes and types are not specified for additional text but designers shall ensure clarity of all text and use larger fonts to emphasize critical information.

8   Outer Package Labeling for Containers and Supplies

Outer cartons containing collection containers or other supplies should be marked for electronic data capture using bar coded information in accordance with the GS1 standard. At a minimum the information encoded should include (GS1 Application Identifier shown in parentheses):

- Global Trade Item Number (01);
- Batch or Lot Number (10);
- Expiration Date (17).

According to GS1 recommendations, this information should be carried in a GS1-128 barcode placed on the carton. GS1 general specifications give full detail about the data structure and the encryption into the barcode. The following example illustrates how the information is carried in a GS1-128 barcode.

Figure 9   GS1 Outer Packaging Bar Code

(01) 0 3205000 00400 4 (17) 090930 (10) abc123

Technical Bulletin 9 Blood Bag Identification Using ISBT 128 and GS1, which is available on the ICCBBA Website, provides guidance to blood bag manufacturers, their customers, and software developers on the bar coding of blood bags and their shipping containers. It deals with the relationship between information held in the GS1 carton codes and the ISBT 128 blood container label codes and recommends ways to simplify the mapping of this information.

9 Data Structure Coding and Decoding: Examples of Use

9.1 Data Structure 012 — Special Testing: Red Blood Cell Antigens–General

The following is an example of the use of Data Structure 012 (Table 9).

Example 1:

Consider the following data content string:

880000008700000000

this data content string is decoded as follows:

C-c+E-e+, K+k+;
Cw, Miª, M, N, S, s, U, P1, Luª, Kpª, Leª, Leᵇ not tested;
Fy(a+b+), Jk(a+b-),
Doª, Doᵇ, Inª, Coᵇ, Diª, VS/V, Jsª, CMV antibody not tested.

Example 2:

679999999999999900

decodes as:

C+c-E-e+, K+k-, no other information.

Example 3:

999999999999999100

decodes as:

CMV antibody negative; no other information.

Example 4:

486881355800000000

decodes (rearranged to conform to a typical reporting practice) as:

C+Cʷ+c+E+e+ K+ k+ M+N+S+s+ P1- Lu(a-) Le(a-b+) Fy(a-b+) Jk(a+b+);
VS/V Miª U Kpª Jsª Diª Doª Doᵇ Coᵇ Inª and CMV not tested.

The interpretation of the two (2)-character "ii" data content string is as follows. If the "ii" string is "99," then no information is provided (the default). If a number between "01" and "98" appears, the antigen (or characteristic) shown next to the value in Table 12, page 98, has been tested for and found negative (except for parvovirus). For example, "55" indicates Di(b-). If the value is "00," then further information is provided, either on the container label, or in some other manner.

National guidelines should be consulted for specific information regarding the printing of this bar code text. As a further example, rather than the complete red blood cell phenotype associated with Data Structure 012, the bar code text may read:

> Phenotype provided in accompanying documentation

or some similar phrase. Alternatively, the antigen profile relevant to the recipient may be emphasized with the notation that the remainder of the interpretation of the bar code is presented elsewhere.

9.2 Data Structure 014 — Special Testing: HLA and Platelet-Specific Antigens

Examples of Use

Refer to Table 14, beginning on page 100, Table 15, page 102, and Table 16, page 103.

An individual of homozygous HLA-A2, B7 type and no information about platelet-specific antigens would be coded as:

> 029907999999999900 (if only the phenotype is known)
> 020207079999999900 (if the genotype is known)

Two AA values are always needed, followed by two BB values. To conform to practice the lower value should always be listed first.

An individual of HLA-A210, 24; B8, 2708 and no information about platelet-specific antigens would be coded as:

> 022408279999999900

An HPA-1a (PlA1)-negative individual when there is no HLA typing data would be coded as:

> 999999993999999900

An HPA-1a (PlA1)-negative individual of HLA phenotype A2, B8 would be coded as:

> 029908993999999900

An IgA-deficient, CMV-antibody negative individual would be coded as:

> 999999999999999400

An individual of homozygous HLA-A2, B7 type with no information about platelet-specific antigens and with no high titered anti-A and -B detected would be coded as:

029907999999999901 (if only the phenotype is known)
020207079999999901 (if the genotype is known)

9.3 Data Structure 023: Compound Messages

Data Structure 023 Compound Messages allow multiple data structures to be combined into a single data string to facilitate use of newer technology delivery systems (see 2.4.23, page 60).

Examples:

A compound message using defined structured message 003 would look like:

=+04003=G15170612345600=%5100=<E0001000&>0140252359

where

=+04003 identifies this as a compound message of four data structures using the format defined for structured message type 003;

=G15170612345600 is the Donation Identification Number Data Structure;

=%5100 is the Blood Groups Data Structure;

=<E0001000 is the Product Code Data Structure;

&>0140252359 is the Expiration Date and Time Data Structure.

An undefined message example is:

=+03000=G15170612345600=%5100&(N0001

where

=+03000 identifies this as an undefined message structure containing three ISBT 128 data structures. The three following data structures have to be parsed and identified on the basis of their data identifiers.

In this case the three following data structures are Donation Identification Number [001], Blood Groups [002], and Special Testing: General [010].

9.4 Data Structure 027: Infectious Markers

The Infectious Markers Data Structure allows complex testing information to be conveyed electronically (see 2.4.27, page 65).

Example: A product has the following test results:

HIV-1/2 antibody	Negative
HIV-p24	Not tested
HIV genomic	Not tested
HCV antibody	Positive
HCV antigen	Not tested
HCV genomic	Negative
HBc antibody	Negative
HBs antigen	Negative
HBV genomic	Not tested
HTLV-I/II antibody	Negative
Syphilis antibody	Negative
CMV antibody	Positive
CMV genomic	Not tested
EBV genomic	Not tested
WNV genomic	Not tested
Parvo B19 antibody	Not tested
Parvo B19 genomic	Not tested
Chagas antibody	Not tested

Using the Infectious Markers Data Structure, this would be encoded according to Table 19, page 105, as:

321415000000000000

10   Bar Code Concatenation

This chapter provides the technical description of ISBT 128 concatenation for Code 128 symbols. It assumes an understanding of concatenation concepts and the basic differences between ISBT 128 concatenation and standard Code 128 concatenation. Additional background information can be obtained from the ICCBBA publications *Technical Note 2, Length of the Product Code Bar Code and Concatenation* and *Technical Bulletin 5, Bar Code Scanner ISBT 128 Concatenation*. These documents may be found on the ICCBBA Website.

10.1 Temporal/Spatial Constraints

Temporal and/or spatial constraints shall be met before a pair of codes can be concatenated. The detailed requirements are:

- the gap between last bar of the left bar code and the first bar of the right bar code shall be 36X ± 16X (That is equivalent to 9 ± 4 mm when the X dimension is 0.25 mm)
- both bar codes shall be oriented in the same manner (the Standard allows flexibility to accommodate slight misalignment, but labels should be affixed so that the bars in the bar codes are as close to parallel as possible)
- vertical alignment shall allow a single straight line scan to pass completely through both bar codes
- no vertical lines may appear between pairs of bar codes that are meant to be concatenated
- the stop codes shall be on the same side of both bar codes

Other variations of label design or placement shall not interfere with concatenation of paired bar codes (DIN and Blood Group; Product Code and Expiration Date and Time; and Container Manufacturer and Catalog Number and Container Lot Number).

In addition to these requirements, the X dimensions of both bar codes should be the same.

Note: The previous mandatory requirement for having the same X dimension for both bar codes was removed in version 3.0.0. However, recent evidence indicates this may cause problems. Until further evidence is available, we strongly recommend that the two bar codes be of the same X dimensions.

If any of the above constraints are not met the concatenation process shall be aborted. The scanner/decoder should immediately output the data of the correctly-read first bar code as if read without concatenation (this may be either bar code of the pair depending on the direction of scan). Reading and output of data from any other bar codes scanned then continues as an independent operation, as if a new scan had been started.

The techniques recommended to scanner manufacturers to ensure that the spatial separation constraint is applied are detailed in *Technical Bulletin 5*.

No maximum length for a pair of bar codes for concatenation is defined. However, the maximum length of a code pair that can be read will be determined by the scanner design.

10.2 Output Data String

ISBT 128 concatenation shall result in a single output data string containing the data from the left bar code followed by the data from the right bar code, regardless of the order of scanning. The terms left and right bar code are defined such that the stop code of the left bar code is adjacent to the start code of the right bar code.

The output data string shall contain all data characters in each bar code, including the data identifiers, in left-to-right byte order (i.e., starting with the left primary data identifier) regardless of the direction in which the bar codes are scanned. Internal Code 128 control characters, such as start, stop, and subset shift are non-data characters and thus do not appear in the output string.

10.3 Controlling the Concatenation Process

At any point in the bar code data entry process one of the following concatenation requirements shall apply:

a) concatenated read required;
b) concatenated read prohibited;
c) concatenated read permitted but not required.

Enforcement of these requirements may be carried out either by the host application software or by programming the scanner.

Where control is carried out by the application software, the scanner shall be configured to allow both single and ISBT 128 concatenated reads. The application software can then apply the required control (a, b, or c) for each scanning transaction.

Alternatively, scanners that support internal control of ISBT 128 concatenation mode may be programmed to allow ISBT 128 concatenation mode configuration, allowing the scanner to be set to operate according to a, b, or c above. Requirements a and b are referred to as static modes, and when configured to one of these the scanner will enforce the requirement every time an ISBT 128 bar code is scanned. If the scanner is configured to dynamic mode, c, then both single and concatenated reads are allowed.

10.4 Verification of Valid Concatenation

The above rules ensure that a concatenated read occurs only when required. This section is concerned with verifying the pair of bar codes once they have been received.

The ISBT 128 concatenation methodology allows the concatenation of any pair of ISBT 128 bar codes; however, in general, only a limited set of bar code pairs will be concatenated. Once again, control over this verification can be carried out either by the host application software or by the scanner software.

Using application software control, the application may be written to accept only the expected concatenated pair at each input event. The scanner in this situation shall be configured to pass through any pair of valid ISBT 128 bar codes.

Alternatively, the scanner may be configured to allow only specific pairs of bar codes to be accepted. Where such control is used it is essential that the scanner configuration permit the table of acceptable bar code pairs to be modified and extended. A Concatenation Programming Bar Code has been provided as an ISBT 128 data structure to support the management of acceptable pairs. Detailed consideration of this process is provided in *Technical Bulletin 5.*

10.5 Commonly Concatenated Bar Code Pairs

The following is a list of bar code pairs that are commonly concatenated. The list is not exhaustive and the Standard allows any pair of ISBT 128 codes to be concatenated. Reference to the corresponding data structure is given in parentheses.

- Donation Identification Number [001] and Blood Groups [ABO and RhD] [002]
- Product Code [003] and Expiration Date and Time [005]
- Donation Identification Number [001] and Product Code [003]
- Donation Identification Number [001] and Donor Identification Number [019]
- Container Manufacturer and Catalog Number [017] and Container Lot Number [018]
- Manufacturer and Catalog Number: Items Other Than Containers [021] and Lot Number: Items Other Than Containers [022]
- Patient Birth Date [024] and Patient Identification Number [025]

It is possible to concatenate other pairs of ISBT 128 bar codes and these can be specified within some scanner systems (see *Technical Bulletin 5*).

11 Blood Container Manufacturers Information Data File Specification

11.1 Introduction

The purpose of this data file is to provide a mechanism for electronically transferring information about blood container sets that will assist in process control. This data can be used to track and/or limit usage of the set; to verify that the product in the container is appropriate for the container; and to minimize the need for manual record keeping.

For the purposes of standardization, the data file structure, field definitions and formats, and default values are defined by ICCBBA.

Manufacturers are responsible for providing their own data files which are maintained in an electronic format available to their customers.

Data files are associated with a container set through the Container Manufacturer and Catalog Number [Data Structure 017] present on the base label of the container. The data file for each catalog number includes information that is:

Specific to the collection set:

- Number of containers in the set
- Intended use of each container (i.e., red cells, whole blood, plasma, platelets, or buffy coat)
- Nominal collection volume for the primary container (optional)
- Presence of fluids in containers that are not suitable for storage of blood or cellular therapy products (optional)

Specific to the container:

- Which container (red cell/whole blood, plasma, platelets, or buffy coat) within the set is being scanned
- Amount and type of fluid as supplied (anticoagulant, additive, etc.)
- Nominal, minimum, and/or maximum volume that each container is designed to hold (optional)
- Whether the container is downstream from a leukocyte reduction filter

Users may download into their information system the data file for each blood container catalog number purchased. With appropriate software, the catalog number bar code on a blood container can be scanned during use and linked to the data file to obtain or document a complete description of the set and containers. For example, by scanning the bar code on a whole blood collection set and linking it to the data file, the user can document the set manufacturer, the intended collection volume (e.g., 450 mL), the anticoagulant and its volume, and the number and type of attached containers.

The information in this data file is not intended as a specification of a container or a container set, but solely to provide process control information for use in blood collection management systems.

11.2 Structure of the Data File

The data file structure specifies the field definitions and formats together with default values and lookup table references. Beginning with Version 05 of the Manufacturers Data File, the message structure may be in either an XML message or an ASCII text file using comma separated values (CSV). A separate data file shall be created for each catalog number. The structure shall comprise a header line, a variable number of data lines, and for CSV files, a footer line.

Each data line shall be identified by a data label indicating what information the line contains. Data labels, together with the format of the data content, shall be assigned by ICCBBA to ensure commonality across all suppliers. The data line shall also contain a container identification character to indicate which container in the set is being described. The container identification character shall be set to the hash/number symbol (#) for information common to the entire set.

The data file specification shall be version controlled with the version number being held in the header line.

Table 31   Header Line [RT031]

Field	Length	Format	Comment
1	8	alpha (8)	Fixed text "ICCBBAMF" identifies this as an ICCBBA-specified Manufacturers File format
2	2	numeric (2)	Two (2)-digit version number identifies the version of the data structure with which this message is compliant (currently all messages are 06, i.e., this version of the data file)

Table 32   Data Lines [RT032]

Field	Length	Format	Comment
1	max 20	alphanumeric (max 20)	ICCBBA-defined data label (see Table 34)
2	1	alphanumeric or "#" (1)	Set to # for information relevant to the whole set, or the container identification character from the Container Manufacturer and Catalog Number [Data Structure 017] for information specific to all containers with this identification character in the set. Numeric container identification characters shall be used for whole blood and other non-apheresis collection sets. 1 shall be reserved for the primary collection container. Alphabetic (A-Z) container identification characters shall be used for apheresis sets. Transfer sets shall use zero (0) for container identification. If multiple bag types are found in a transfer bag set, numeric characters 2-9 shall be used.
3	variable	alphanumeric (var)	Data content (see below). Data shall not contain the comma character as this is the field delimiter. Other non-alphanumeric characters used as default delimiters in HL7 messages should also be avoided (|^~\&)

Table 33   Footer Line [RT033]

Field	Length	Format	Comment
1	8	alpha (8)	fixed text "FILETERM"
2	variable	numeric	count of number of data lines in file

Table 34   ICCBBA-Assigned Data Labels and Content (Version 06) [RT034]

Data Label	Content	Format (max length)	Required *	Default Value	Application
MANUFACTURER	Identity of the container set manufacturer (uses the ICCBBA identification letters assigned in the Manufacturer Identifier Codes, see RT016)	Alpha (2)	M	N/A	Set
CATALOGNUMB	Manufacturer's catalog number (seven data characters as read from Container Manufacturer and Catalog Number Data Structure)	Alphanumeric (7)	M	N/A	Set
CATNUMBTEXT	Manufacturer's catalog number as printed in documentation	free format	M	N/A	Set
GS1GTIN	The GS1 Global Trade Item Number	Numeric (14)	O	N/A	Set
GS1GTINCONTENT	The number of items in the carton	Numeric (3)	O	N/A	Set
CONTAINERNUMB	Number of containers in set (when field 2 = #) or number of containers with specified container identification character (when field 2 = container identification character).	Numeric (2)	M	N/A	Set
COLLECTIONVOL	The nominal collection volume for whole blood donations (in mL)	Numeric (3)	O	N/A	Set

Data Label	Content	Format (max length)	Required *	Default Value	Application
CONTENT	The fluid content of the container as supplied (anticoagulant, additive, etc.)	select from ICCBBA lookup table‡	D	NONE	Container
CONTENTVOL	The volume of the fluid described in the CONTENT field (in mL)	Numeric (3)	O	N/A	Container
PLTCONTAINER	Indicator if this is a container suitable for the storage of platelets (liquid phase)	Y or N	D†	N	Container
PMACONTAINER	Indicator if this is a container suitable for the storage of plasma (liquid or frozen)	Y or N	D†	N	Container
RBCCONTAINER	Indicator if this is a container suitable for the storage of red cells (liquid phase)	Y or N	D†	N	Container
BFYCONTAINER	Indicator if this is a container suitable for the storage of buffy coat (liquid phase)	Y or N	D†	N	Container
PROCONLY CONTAINER	Indicator that this is a container suitable for in-process product only (not designed for storage of final product)	Y or N	D†	N	Container
LEUKREDFILTER	Indicates whether the container is downstream of a leukocyte reduction filter	Y or N	D†	N	Container
NOMINALVOLUME	The volume of final product that the container is designed to hold (in mL)	Numeric (4)	O	N/A	Container

Data Label	Content	Format (max length)	Required *	Default Value	Application
MINVOL	The minimum amount of product that the container is designed to hold (in mL)	Numeric (4)	O	N/A	Container
MAXVOL	The maximum amount of liquid product the container is designed to hold (in mL)	Numeric (4)	O	N/A	Container
MAXFRZVOL	The maximum amount of frozen product the container is designed to hold (in mL)	Numeric (4)	O	N/A	Container
SOLN1	A solution (e.g., additive solution or pathogen inactivation solution) that is integrally attached to the set but not contained within a container designed to store blood components	Alphanumeric (7)	O	N/A	Set
SOLN1VOL	The volume (in mL) of Solution 1	Numeric (4)	O	N/A	Set
COMMENT	Field that is available for manufacturers to add comments; end-users are not expected to upload this information	Alpha (200)	O	N/A	Both

N/A = not applicable*; Y = yes; N = no

M = mandatory; O = optional (included at manufacturer's discretion); D = default value applies if the data line is not present

† At least one of the PLTCONTAINER, PMACONTAINER, RBCCONTAINER, BFYCONTAINER , or PROCONLYCONTAINER fields shall be set to Y for each container type

‡ This table can be found in the definitions for Core Conditions in the ICCBBA document *ISBT 128 Standard Terminology for Blood, Cellular Therapy, and Tissue Product Descriptions* in the Technical Documentation area of the ICCBBA Website.

11.3 Container Identification Character

The container identification character used on blood containers can be implemented in two distinct ways. The option adopted by any particular manufacturer will depend upon their manufacturing process. It would not be appropriate for a customer to place a requirement on a manufacturer to adopt either of these options. The structure of the data file has been configured to accommodate both options and software systems should to be designed to accept both.

Option 1
Each container in the set bears a unique container identification character. This is the simplest format, and each container will have a set of entries in the data file corresponding to its container identification character.

Option 2
Each distinct container in a set bears a unique container identification character. Where a set contains two or more containers that are identical in terms of their composition, purpose, and position in the configuration, then these containers may be given the same container identification character. In this case, the data field for the number of containers will indicate how many containers there are with the specified container identification character and there will be a single set of entries in the data file common to all these containers.

11.4 Further Guidance

Detailed information about implantation of the Manufacturers Data File, multiple examples of use, and example data files may be found in *Implementation Guide: Use of the Manufacturers Data File.* This document may be found on the ICCBBA Website.

12   Use of ISBT 128 Data Structures in HL7 Messages

Per its Website (www.hl7.org), Health Level Seven International (HL7) is "a not-for-profit, ANSI-accredited standards developing organization dedicated to providing a comprehensive framework and related standards for the exchange, integration, sharing, and retrieval of electronic health information that supports clinical practice and the management, delivery and evaluation of health services. HL7's 2,300+ members include approximately 500 corporate members who represent more than 90% of the information systems vendors serving healthcare."

HL7 is an electronic messaging standard that allows communication between disparate computer systems. Within an HL7 message, there may be coded values. Some of these coded values are from HL7 maintained tables, some are from user defined tables, and others are from external tables. According to the HL7 standard, an external table is "a set of coded values defined and published by another standards organization." ICCBBA is recognized by HL7 as such a standards organization. ICCBBA maintains tables, such as Table 35 [RT042], which is referenced in HL7 in its Vocabulary Table 0396 on the HL7 Website. This allows ICCBBA to specify how ISBT 128 data structures and other transfusion and transplantation information can be included in HL7 messages in a structured manner.

Table 35 [RT042] specifies identifiers that may be used in encoding ISBT 128 data structures into HL7 messages. Additional lines may be added to the table upon request by contacting the ICCBBA office (techdir@iccbba.org).

Table 35   IBT0001 Coding System Reference Table [RT042]

Identifier	Object Identifier (OID)	Text Name	Description	Data Example
IBT1-0001	2.16.840.1.113883.6.18.2.1	Donation Number	Thirteen character donation number element from an ISBT 128 Donation Identification Number [Data Structure 001]. (In this case includes the second data identifier which is also the first data character)	G151708123456
IBT1-0002	2.16.840.1.113883.6.18.2.2	Flag Value	Two character code corresponding to the flag characters from an ISBT 128 Donation Identification Number [Data Structure 001]. See Table 3 [RT004] for acceptable values and their interpretation.	01

Identifier	Object Identifier (OID)	Text Name	Description	Data Example
IBT1-0003	2.16.840.1.113883.6.18.1.1	Donation and Flag	Fifteen-character code corresponding to an ISBT 128 Donation Identification Number [Data Structure 001] (In this case includes the second data identifier which is also the first data character). See Table 3 [RT004] for acceptable values of flag element and their interpretation.	G15170812345601
IBT1-0004	2.16.840.1.113883.6.18.1.2	Blood Groups	Four character code corresponding to an ISBT 128 Blood Group [ABO and RhD] [Data Structure 002]. See Table 4 [RT005] and Table 5 [RT006] for acceptable values and their interpretation.	5100
IBT1-0005	2.16.840.1.113883.6.18.2.3	ABO RhD	ISBT 128 two character ABO/RhD code. See Table 4 [RT005] for acceptable values and their interpretation.	51
IBT1-0006	2.16.840.1.113883.6.18.2.4	Special Messages	ISBT 128 two-character Special Message. See Table 5 [RT006] for acceptable values and their interpretation.	Mq
IBT1-0007	2.16.840.1.113883.6.18.2.5	Rh K Mur	ISBT 128 single character value corresponding to third data character of Data Structure 002 and encoding Rh, Kell and Mia/Mur phenotypes. See Table 6 Table 6 [RT007] for acceptable values and their interpretation.	B
IBT1-0008	2.16.840.1.113883.6.18.1.3	Product Code	Eight character ISBT 128 Product Code [Data Structure 003], referencing the ISBT 128 Product Description Code Database and Table 7 [RT008].	E0001V00
IBT1-0009	2.16.840.1.113883.6.18.2.6	Product Type	Five character code corresponding to the Product Code in first five characters of Data Structure 003 and the last 5 characters of Data Structure 034. It references a value in the ISBT 128 Product Description Code Database.	E0123
IBT1-0010	2.16.840.1.113883.6.18.2.7	Type of Donation	Single character code corresponding to the sixth character of an ISBT 128 Product Code [Data Structure 003] and specifying donation type. See Table 7 [RT008] for acceptable values and their interpretation. Only used for blood and cellular therapy products.	V

Identifier	Object Identifier (OID)	Text Name	Description	Data Example
IBT1-0011	2.16.840.1.113883.6.18.2.8	First Division	Single character code corresponding to the seventh character of an ISBT 128 Product Code [Data Structure 003] and indicating a division value or a flag to an alternative division number code. Only used for blood and cellular therapy products.	A
IBT1-0012	2.16.840.1.113883.6.18.2.9	Second Division	Single character code corresponding to the eighth character of an ISBT 128 Product Code [Data Structure 003] indicating a division value or a flag to an alternative division number code. Only used for blood and cellular therapy products.	b
IBT1-0013	2.16.840.1.113883.6.18.2.10	Division Number	Three digit code corresponding to the sixth to eighth character of an ISBT 128 Product Code [Data Structure 003]. Not used for blood or cellular therapy products. Indicates the division number of the product.	017
IBT1-0014	2.16.840.1.113883.6.18.1.4	Expiration Date	Six digit code corresponding to an expiration date as defined for ISBT 128 Data Structures 004 and 005.	008120
IBT1-0015	2.16.840.1.113883.6.18.2.11	Expiration Time	Four digit code corresponding to an expiration time as defined for ISBT 128 Data Structure 005.	1900
IBT1-0016	2.16.840.1.113883.6.18.1.6	Collection Date	Six digit code corresponding to a collection date as defined for ISBT 128 Data Structures 006 and 007.	008120
IBT1-0017	2.16.840.1.113883.6.18.2.12	Collection Time	Four digit code corresponding to a collection time as defined for ISBT 128 Data Structure 007.	1900
IBT1-0018	2.16.840.1.113883.6.18.1.8	Production Date	Six digit code corresponding to a production date as defined for ISBT 128 Data Structures 008 and 009.	008120
IBT1-0019	2.16.840.1.113883.6.18.2.13	Production Time	Four digit code corresponding to a production time as defined for ISBT 128 Data Structure 009.	1900
IBT1-0020	2.16.840.1.113883.6.18.1.10	Special Testing General	Five character code corresponding to an ISBT 128 Special Testing – General code [Data Structure 010]. See Special Testing: General Database Table for acceptable values and their interpretation.	N0001

Identifier	Object Identifier (OID)	Text Name	Description	Data Example
IBT1-0021	2.16.840.1.113883.6.18.1.12	Special Testing RBC General	Eighteen digit code corresponding to an ISBT 128 Special Testing: Red Blood Cell Antigens – General code [Data Structure 012]. See Table 9 [RT009] and Table 12 [RT011] for acceptable values and their interpretation.	486881355800000000
IBT1-0022	2.16.840.1.113883.6.18.1.13	Special Testing RBC Finnish	Eighteen digit code corresponding to an ISBT 128 Special Testing: Red Blood Cell Antigens – Finnish code [Data Structure 013]. See Table 10 [RT010] and Table 13 [RT012] for acceptable values and their interpretation.	486881355800000000
IBT1-0023	2.16.840.1.113883.6.18.1.14	Special Testing Platelets	Eighteen digit code corresponding to an ISBT 128 Special Testing: Platelet HLA and Platelet Specific Antigens code [Data Structure 014]. See Table 14 [RT013], Table 15 [RT014], and Table 16 [RT044] for acceptable values and their interpretation.	022408279999999900
IBT1-0024	2.16.840.1.113883.6.18.1.15	Special Testing HLA- A and HLA-B Alleles	Eighteen digit code corresponding to an ISBT 128 Special Testing: HLA-A and –B Alleles code [Data Structure 015]. See the IMTG/HLA database (http://www.ebi.ac.uk/imgt/hla/) and [RT015] for acceptable values and their interpretation.	010302010702270519
IBT1-0025	2.16.840.1.113883.6.18.1.16	Special Testing DRB1	Eighteen digit code corresponding to an ISBT 128 Special Testing: HLA-DRB1 Alleles code [Data Structure 016]. See the IMTG/HLA database (http://www.ebi.ac.uk/imgt/hla/) for acceptable values.	100115019999999999
IBT1-0026	2.16.840.1.113883.6.18.1.17	Container Mfr and Cat	Ten character code corresponding to an ISBT 128 Container Manufacturer and Catalog Number [Data Structure 017]. Refer to [RT016] for manufacturer codes.	1BA0027QZE
IBT1-0027	2.16.840.1.113883.6.18.1.18	Container Lot	Ten character code corresponding to an ISBT 128 Container Lot Number [Data Structure 018].	0000123456
IBT1-0028	2.16.840.1.113883.6.18.1.19	Donor ID	Twenty-one character code corresponding to an ISBT 128 Donor Identification Number [Data Structure 019].	W00000000000012436744
IBT1-0029	2.16.840.1.113883.6.18.1.20	Staff ID	Eleven character code corresponding to an ISBT 128 Staff Member Identification Number [Data Structure 020].	W0000016902

Identifier	Object Identifier (OID)	Text Name	Description	Data Example
IBT1-0030	2.16.840.1.113883.6.18.1.21	Other Mfr and Cat	Ten character code corresponding to an ISBT 128 Manufacturer and Catalog Number: Items other than containers [Data Structure 021]. Refer to [RT016] for manufacturer codes.	IS000RA123
IBT1-0031	2.16.840.1.113883.6.18.1.22	Other Lot	Ten character code corresponding to an ISBT 128 Lot Number: Items Other Than Containers [Data Structure 022].	0000435678
IBT1-0032	2.16.840.1.113883.6.18.1.24	Patient DOB and information location	Ten character code corresponding to an ISBT 128 Patient Date of Birth [Data Structure 024]. Note that this structure includes a location code (defined on RT018) together with the Date of Birth in yyyymmdd format	0119541217
IBT1-0033	2.16.840.1.113883.6.18.1.25	Patient ID and information location	Variable length field corresponding to an ISBT 128 Patient Identification Number [Data Structure 025]. Note that this structure includes a location code (defined on RT018) and patient number field length together with the patient number	0106923832
IBT1-0034	2.16.840.1.113883.6.18.1.27	Infectious Markers	Eighteen digit code corresponding to an ISBT 128 Infectious Markers code [Data Structure 027]. See [RT019] for acceptable values and their interpretation.	321415000000000000
IBT1-0035	2.16.840.1.113883.6.18.1.29	One or more Dimensions	Variable length field corresponding to an ISBT 128 Dimensions [Data Structure 029]. Refer to Table 20 [RT0037], Table 21 [RT038], and Table 22 [RT039]	0101000700031000
IBT1-0036	2.16.840.1.113883.6.18.1.30	Multiple Red Cell Antigens with Test History	Variable length field corresponding to multiple ISBT 128 Red Cell Antigens with their Test Histories [Data Structure 030]. Refer to Table 23 [RT040], Table 24 [RT041] and the red cell antigen nomenclature table found at http://www.isbtweb.org/fileadmin/user_upload/WP _on_Red_Cell_Immunogenetics_and/Table_of_bl ood_group_antigens_within_systems_v3.0_12102 8.pdf	0040040020201004004020 4004003010300400502020

Identifier	Object Identifier (OID)	Text Name	Description	Data Example
IBT1-0037	2.16.840.1.113883.6.18.2.14	Individual Red Cell Antigen with Test History	Ten digit code corresponding to an individual ISBT 128 Red Cell Antigen and its test history within Data Structure 030. Refer to Table 23 [RT040], Table 24 [RT041] and the red cell antigen nomenclature table found at http://www.isbtweb.org/fileadmin/user_upload/WP_on_Red_Cell_Immunogenetics_and/Table_of_blood_group_antigens_within_systems_v3.0_121028.pdf	0040020201
IBT1-0038	2.16.840.1.113883.6.18.2.15	Individual Product Dimension	Twelve digit code corresponding to a single dimension of a product within the ISBT 128 Dimensions [Data Structure 029]. Refer to Table 20 [RT0037], Table 21 [RT038], and Table 22 [RT039]	010007000310
IBT1-0039	2.16.840.1.113883.6.18.2.16	Information Location	Two digit code corresponding to a location code identifying where the occurrence of the information was held. Refer to Table 18 [RT018]	01
IBT1-0040	2.16.840.1.113883.6.18.2.17	Patient Date of Birth	Eight digit code corresponding to an ISBT 128 Patient Date of Birth [Data Structure 024].	20011203
IBT1-0041	2.16.840.1.113883.6.18.2.18	Patient Identification Number	Variable length field corresponding to an ISBT 128 Patient Identification Number [Data Structure 025].	06923832
IBT1-0042	2.16.840.1.113883.6.18.1.31	Flexible Date and Time	Sixteen digit code corresponding to a time and date defined within the code for Data Structure 031. Refer to Table 25 [RT045] and Table 26 [RT046]	1001201311042359
IBT1-0043	2.16.840.1.113883.6.18.1.32	Product Divisions	Six character code corresponding to the ISBT 128 Product Divisions Code for Data Structure 032.	AABC00
IBT1-0044	2.16.840.1.113883.6.18.2.19	Facility Identification Number	Five character code corresponding to the ISBT 128 Facility Identification Number of the facility that assigned the Product Code and referencing a value in the ISBT 128 Registered Facilities Database [Data Structure 033 or 034]	A9999
IBT1-0045	2.16.840.1.113883.6.18.2.20	Facility Product Code	Six character code in Data Structure 033 corresponding to facility-defined product code (FPC). [Data Structure 033 or 034]	AB7878

Identifier	Object Identifier (OID)	Text Name	Description	Data Example
IBT1-0046	2.16.840.1.113883.6.18.1.34	Processor Product Identification Code	Sixteen character code corresponding to (1) the ISBT 128 Facility Identification Number of the facility that processed or labeled the product, (2) a six character code corresponding to the facility-assigned product code or catalog number, and (3) a five character code corresponding to the ISBT 128 Product Description Code. Provides the UDI Device Identifier for medical devices containing medical products of human origin. [Data Structure 034]	A9999AB1234T1234
IBT1-0047	2.16.840.1.113883.6.18.1.35	MPHO Lot Number	Eighteen character code corresponding to an ISBT 128 MPHO Lot Number [Data Structure 035].	00000ABC123cba3210
IBT1-0048	2.16.840.1.113883.6.18.1.36	MPHO Supplemental Identification Number	Eighteen character code corresponding to an ISBT 128 MPHO Supplemental Identification Number [Data Structure 036].	00054321EFG123hk00

13   ICCBBA

13.1 Formation and Incorporation

ICCBBA was established in 1994 to support ISBT 128 and to assist in its implementation. ICCBBA was incorporated in the Commonwealth of Virginia in 1995, and is a 501(c)(3) not-for-profit organization.

ICCBBA is a nongovernmental organization (NGO) in official relations with the World Health Organization (WHO).

13.2 Registration and Licensing

Each facility that implements ISBT 128, or plans to implement ISBT 128 and needs access to password-protected information from the ICCBBA Website, must register with ICCBBA. Specific requirements for registration and a form for this purpose may be found on the ICCBBA Website. Special arrangements are available for facilities in developing countries that wish to use ISBT 128 Donation Identification Numbers in an eye-readable format only.

Before implementing ISBT 128, each registered facility shall pay the annual license fee. The annual license fee is set by the ICCBBA Board of Directors to cover the anticipated expenses for the fiscal year for which the fee is assessed. It is invoiced to every registered facility at its last known address early in each calendar year. Failure to pay the annual fee is an indication that the facility will no longer be using or providing support for ISBT 128. The terms under which ISBT 128 is licensed for use are provided in the ICCBBA License Agreement, a copy of which can be found on the ICCBBA Website.

ICCBBA assigns facility and manufacturers codes. The facility codes are published in the password-protected area of the ICCBBA Website. See *Implementation Guide: ISBT 128 Facility Identification Number* for further information.

Vendor codes for manufacturers who encode their identities in Data Structure 017 or 021 are found on Table W1 [RT016] on the ICCBBA Website. Vendors may obtain codes by contact the ICCBBA office.

13.3 Code Assignment

All codes used in ICCBBA data structures, with the exception of those codes designed specifically for national or local use, are assigned by ICCBBA. Once assigned, the codes are kept in the appropriate reference table or database table. Reference tables and database tables are found either in this document or in the password-protected area of the ICCBBA Website.

13.4 Issuing Agency Identifier

ICCBBA has been recognized as an Issuing Agency of unique identifiers under ISO/IEC 15459. This standard specifies procedural requirements to maintain a non-

significant, unique identifier for item management applications and outlines the obligations of the Registration Authority and Issuing Agencies.

The ICCBBA Issuing Agency Code (IAC) is **LI**.

Glossary

Bar code	A symbolic representation of a data structure that also includes the symbology-specific start and stop codes.	
	Linear bar code	Single row of bars and spaces In this document the unqualified use of linear bar code implies the use of Code 128 symbology with its associated modulo 103 check character.
	2-D bar code	Two-dimensional pattern of data cells In this document the unqualified use of 2D bar code implies the use of Data Matrix.
Check character	A character used to ensure the accuracy of data. The value is calculated based on an algorithm applied to the data. Examples are the modulo 103 check character internal to Code 128 and the ISO/IEC 7064 modulo 37-2 check character appended to data content text that verifies accurate keyboard entry.	
Concatenation	A method by which the information held in two bar codes is combined in the scanner into a single string of data before being sent to the host computer. ISBT 128 places specific rules on the operation of concatenation which ensures that the two codes are adjacent to one another, hence allowing this feature to be used in label process control. (Note: ISBT 128 concatenation is a specific enhancement to the Code 128 Specification. See Chapter 10 for more information.)	
Container set	Any combination of containers, tubing, and other items as packaged by the manufacturer, intended for the collection of whole blood, apheresis, or cellular therapy procedures.	
Control character	A character inserted into a bar code to control the decoding process (such as that used to indicate a change in the Code 128 symbology subset). In most circumstances these are stripped by the scanner and not transmitted to the host.	
Data character	The individual ASCII characters that make up the data content.	
Data content	The characters in a data structure that encode the information for which the data structure is named. The data content does not include the data identifier. (The Donation Identification Number is an exception to this rule. See Section 2.4.1, page 28.)	
Data identifier	The first two or three characters in a data structure that identify the data structure. These will always be present when the data structure is used as a bar code, but may be omitted when the data structure is used in situations in which the data structure identity is unambiguously and	

	explicitly defined. (The Donation Identification Number is an exception to this rule. The second character of the data identifier can never be dropped because it is also part of the data content. See 2.4.1, page 28.)
Data structure	Information content comprising the data identifier and data content. When a data structure is represented as a bar code, the term data structure does not include the symbology-specific and always present start and stop codes, the modulo 103 check character, or any specified control characters.
Donation Type	A designation indicating why a donation was collected

	Autologous donation	A donation collected from a donor for his or her own use.
	Dedicated donation	A collection arranged by the collecting facility to support a specific recipient on a frequent basis (for example, to ensure limited exposure to allogeneic products).
	Designated donation	A collection from a donor called by the collecting facility to provide product (for example, HLA-compatible) to be used by a specific recipient (or for Cellular Therapy products, possibly a small group of recipients).
	Directed donation	A collection from a donor who presents to the collecting facility at the request of another person intending to provide product to be used by that person.

Facility	An organization that is responsible for the collection/recovery, processing, and/or distribution of ISBT 128-encoded products.
Flag character	Part of the data content of a data structure used in process control or data transmission checking. For ISBT 128, flag characters are used with the Donation Identification Number. Printed in eye-readable format, but distinguished in some manner from the representation of the other data characters.
ISBT 128	An international standard for the transfer of information associated with human tissue transplantation, cellular therapy, and blood transfusion. It provides for a globally unique donation numbering system, internationally standardized product definitions, and standard data structures for bar coding and electronic data interchange.
Julian Date	See Ordinal Date.
Label	An independent entity that may carry one or more bar codes and also provides eye-readable information about the product.

	Affixed label	A label that adheres in physical contact with the product container.

	Attached label	A label that is fastened securely to the product container by means of a tie-tag or comparable alternative.
	Accompanying documentation	Documentation containing product information that is together with the product, or is available to the appropriate individual(s) electronically, but is not affixed or attached to the product.
	Base label	The label placed on a container by a manufacturer. It carries the manufacturer's identity, the catalog number of the container (or container set), and the lot number of the container (or container set) encoded as ISBT 128 data structures.
	Final label	Labeling as it appears on a product ready for release to another entity or for administration to a recipient.
	Partial label	A label that because of size or other constraints does not contain all the required information.
Ordinal Date		A system for maintaining dates that numbers the first day of the year (January 1) as 1 and the last (December 31) as 365 or 366 (in a leap year). Also known as Julian Date.
Phenotype		The observable expression of the genes inherited by a person that reflects the biological activity of the genes. In ISBT 128 coding of test results, the term phenotype includes predicted phenotypes based on genotyping where there is evidence in the literature to support such a prediction.
Plasma Derivative		A product that contains concentrated fractions of plasma proteins that have been separated using physical-chemical or other fractionation processes. It is made from pooling plasma from large numbers of donors and is traced based on the lot or batch number of the pooled product.
Primary container		The container into which the whole blood is drawn.
Retired		A mechanism utilized by ICCBBA to phase out a data structure or code that has become outdated, inadequate, inappropriate, redundant, or discovered to be in error. Because data structures or codes may exist on the labels of products in inventories across the world, the data structures and codes must be retained in the database for backward compatibility. The date on which a data structure or code is retired will be noted in the document in which it appears. This date indicates the date on which ICCBBA recommended the data structure or code no longer be used for new products. Software should be written to recognize these codes, but not assign them to newly created products. It is understood that facilities need time to retire codes after ICCBBA has made its recommendation.

Satellite container	A container other than the primary container in a container set.	
Text	(See Figure 10, page 157)	
	Data content text (previously called eye-readable text)	The eye-readable representation of the data characters in a bar code (printed left justified immediately below the bar code, unless otherwise specified).
	Bar code text	The interpretation of the data content of the bar code.
	Additional text	All other information on the label that is not associated with a bar code.
Transfer container	A container intended for post-manufacturing connection to a container set.	
UTC	Universal Coordinated Time, similar to GMT (Greenwich Mean Time), marks the starting point of every time zone in the World. UTC does not change based on daylight saving (summer) time; thus, the relationship of local time to UTC changes if daylight saving (summer) time is observed.	

Figure 10   Illustration of the Terms Data Content Text, Bar Code Text, and Additional Text
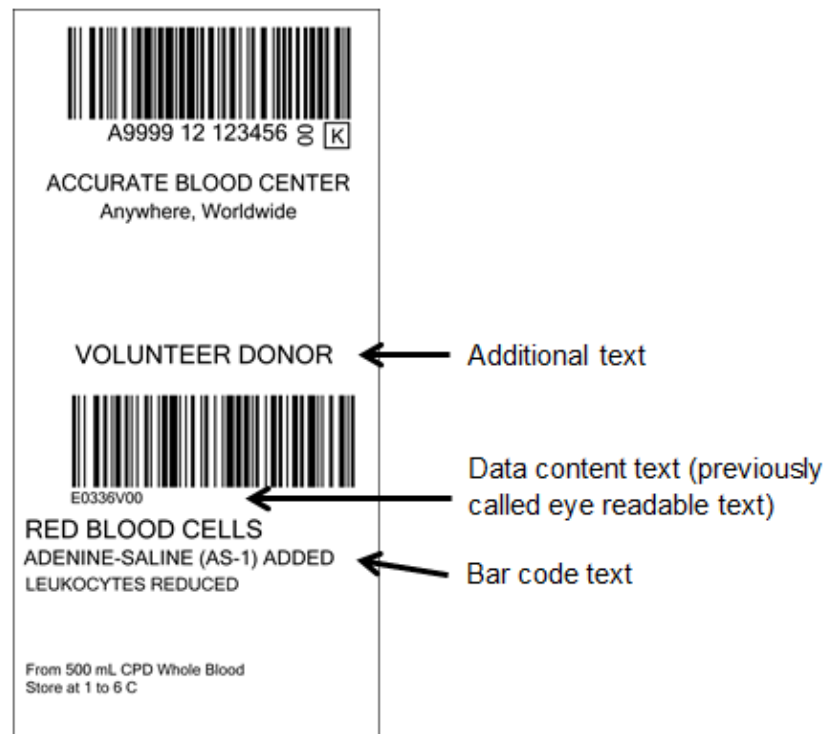

Appendix A Donation Identification Number Check Character [K]

A.1 Keyboard Entry Check Character

ISBT 128 Donation Identification Numbers utilize checksum characters based on the ISO 7064 Mod 37-2 algorithm. This Appendix shows how to calculate the checksum character for any given Donation Identification Number. The calculation is based on the DIN thirteen (13)-character string (*i.e.*, excluding the leading **=** symbol and the flag characters).

The steps in the process are as follows:

1. For each character in the string determine its check value as required by ISO 7064 from Table 36;
2. For each character in the string determine its weighted check value by multiplying the check value from Table 36 by the nth power of 2 where n is the position of the character from the right hand end of the string;
3. Sum the weighted check values from step 2;
4. Find the modulus 37 value of the sum from step 3 (the value **remaining** when the weighted sum is divided by 37);
5. Subtract the value obtained in step 4 from 38;
6. Find the modulus 37 value of the result of step 5 (the value **remaining** when divided by 37);
7. Using the value in Step 6, determine the check character by again referring to Table 36 (this time read the character from the value) — this is the modulo 37-2 checksum character (referred to as K throughout this *Standard*).

Table 36   Mapping from Characters to ISO/IEC 7064 Check Values and Calculated Values to the Checksum Character [RT035]

Character	0	1	2	3	4	5	6	7	8	9	A	B	C
Value	0	1	2	3	4	5	6	7	8	9	10	11	12
Character	D	E	F	G	H	I	J	K	L	M	N	O	P
Value	13	14	15	16	17	18	19	20	21	22	23	24	25
Character	Q	R	S	T	U	V	W	X	Y	Z	*		
Value	26	27	28	29	30	31	32	33	34	35	36		

Example of Calculation

Donation number G1234 12 654321

Position from right (n)	2^n (a)	Character	ISO 7064 value (step 1) (b)	Weighted value (step 2) (a x b)
13	8192	G	16	131072
12	4096	1	1	4096
11	2048	2	2	4096
10	1024	3	3	3072
9	512	4	4	2048
8	256	1	1	256
7	128	2	2	256
6	64	6	6	384
5	32	5	5	160
4	16	4	4	64
3	8	3	3	24
2	4	2	2	8
1	2	1	1	2
Step 3	sum of weighted values			145538
Step 4	modulo 37 (first MOD)			17
Step 5	subtract from 38			21
Step 6	modulo 37 (second MOD)			21
ISO/IEC 37-2 checksum				21
ISBT 128 check character (K)				L

A.2 Computer Programs for Calculating K Using ISO 7064

This is an *informative* section designed to assist programmers by giving two representative methods for the calculation of the Donation Identification Number ISO 7064 modulo 37-2 check character. Both use the "*Pure system recursive method*" for calculation of the check character as documented in Section 7.1 of the ISO/IEC 7064 specification: "Information technology—Security techniques—Check character systems."

Programmers must validate that their programs and algorithms comply with the *normative* ISO/IEC 7064 2003 specification and good programming practice. Programs to generate the check character should also contain sufficient error checking to verify that the first character of the input Donation Identification Number is either an uppercase A–Z, or a digit 1–9 and that all subsequent characters in the input Donation Identification Number are digits.

The following PASCAL language function **ISOmod37_2** calculates and/or validates the ISO 7064 Mod 37-2 pure check character:

```
function ISOmod37_2(DonationInfo:string; K:integer) : char;
(Calculate or validate ISO mode 37-2 pure check character}
function ISOvalue(InputString:string; I:integer) : integer;
begin {Convert ASCII character value to ISO 7064 value in range 0...36}
case InputString[I] of
'0' .. '9': ISOValue := (ord(InputString[I]) - 48);
'A' .. 'Z': ISOValue := (ord(InputString[I]) - 55);
'*': ISOValue := 36;
end;
end {function ISOvalue};
var
J,Sum,CharValue,CheckValue : integer;
const
ISOCharTable : string[37] = '0123456789ABCDEFGHIJKLMNOPQRSTUVWXYZ*';
begin
Sum := 0;
for J:= 1 to K do
begin
CharValue := ISOvalue(DonationInfo,J);
Sum := ((Sum + CharValue)*2) mod 37;
end;
{Check character value is defined to be congruent to 1 mod 37}
CheckValue := (38 - Sum) mod 37;
ISOmod37_2 := ISOCharTable[CheckValue + 1];
end {function ISOmod 37_2};
```

The following 'C' language function **CalculateMod37_2** also implements the *"Pure system recursive method"* documented in Section 7.1 of the ISO/IEC 7064: specification:

```c
int CalculateISO7064Mod37_2(char *inputString)
{
int ch, sum, charValue, isDigit, isUpperAlpha;
static char iso7064ValueToCharTable[] =
"0123456789ABCDEFGHIJKLMNOPQRSTUVWXYZ*";
// Read the characters from left to right.
for (sum = 0; ch = *inputString; inputString++)
{
// Ignore invalid characters as per ISO 7064.
isDigit = ((ch >= '0') && (ch <= '9'));
isUpperAlpha = ((ch >= 'A') && (ch <= 'Z'));
if (isDigit || isUpperAlpha)
{
// Convert the character to its ISO 7064 value.
if (isDigit)
charValue = ch - '0';
else
charValue = ch - 'A' + 10;
// Add the character value to the accumulating sum,
// multiply by two, and do an intermediate modulus to
// prevent integer overflow.
sum = ((sum + charValue) * 2) % 37;
}
}
// Find the value, that when added to the result of the above
// calculation, would result in a number who's modulus 37
// result is equal to 1.
charValue = (38 - sum) % 37;
// Convert the value to a character and return it.
return (iso7064ValueToCharTable[charValue]);
}
```

Appendix B ISBT 128 Standard: Numbering of Versions of Documents and Databases

A three (3)-digit system shall be employed to distinguish versions of the ISBT 128 Standard documents and databases.

For documents:
ISBT 128 Standard documents shall include a version control sheet.

- the third digit shall be increased by one whenever minor typographical errors are corrected or when language is clarified;
- the second digit shall be increased by one and the third digit returns to 0 whenever discreet new entries are made (e.g., a new data structure is inserted) or typographical errors with operational significance are corrected;
- the first digit shall indicate a major revision to the standard or to the document.

For databases:
Databases shall have a version control sheet that shall be maintained on the ICCBBA Website.

For Product Description Code database:
- the third digit shall be increased by one if the only change to the database is an addition to the Product Description table or minor corrections (e.g., spelling) in existing codes;
- the second digit shall be increased by one and the third digit returns to 0 if changes are made to the Class or Attribute tables;
- the first digit shall tie the database to the controlling major revision of the *ISBT 128 Standard Technical Specification*.

For Special Testing database:
- the third digit shall be increased by one if a typographical error is corrected;
- the second digit shall be increased by one and the third returns to 0 each time new item is added;
- the first digit shall tie the database to the controlling major revision of the *ISBT 128 Standard Technical Specification*.

Appendix C Label Examples

Note: A library of example labels from different countries is posted on the ICCBBA Website. Additional label examples may be found in:

- *ISBT 128 Standard Labeling of Blood Components (ST-005)*
- *ISBT 128 Standard Labeling of Cellular Therapy Products (ST-004)*
- *ISBT 128 Standard Labeling of Human Tissues (ST-008)*
- *ISBT 128 Standard Labeling of Ocular Tissue (ST-009)*

Standardized labels for human milk, organs for transplant, and reproductive tissue have not yet been designed.
